TETANUS, from *τῆταια*, root *τενω*, *tendo*, is the name given to a disease of which the essential character is a rigid contraction of certain muscles; which contraction is sometimes called a *tonic* spasm, and is the opposite of that species which alternates with relaxation, and is termed *clonic*, or convulsive. Although tetanus has been employed from the earliest times as a generic term, inclusive of several subdivisions, it will be seen presently that it is itself the peculiar designation of one of those varieties. Three principles of distinction may be noticed in the arrangements of the different specimens of the disorder, hitherto adopted. The most common is derived from observing the different parts of the body or sets of muscles affected in certain cases; whence the ancient names of *emprosthotonos*, *opisthotonos*, *pleurosthotonos*, *tetanus*, and *trismus*. Another, and one of more importance in a practical point of view, is based upon the origin of the disorder, and regards it as idiopathic or symptomatic; a division known also to the ancients: not that they used these very terms, but that a marked distinction was drawn by them between cases which arose from common causes, and those which were the effects of wounds. The third principle of arrangement is derived from the degree and duration of the symptoms, and is most insisted upon in the present day. By virtue of this principle, tetanus is distinguished as acute and chronic. We think it would be convenient to add to these a subacute variety, to include those cases

* Cours d'Anatomie Médicale, t. v. p. 179.

which are of mild character, but which do not continue long enough to be designated chronic.* The grounds on which these several divisions are established will be spoken of in their proper places.

Description.—We shall commence our account of the symptoms of this disease, by a general survey of those phenomena which accompany its progress under all its forms, reserving the distinctive characters of the latter for separate consideration. It will be seen, however, that the most general description must necessarily include trismus, which is a part of each of the other species.

The accession of the disease is sometimes so abrupt as to give no warning of its approach; but in general there are certain precursory symptoms, which, however, can rarely be called *premonitory*, since they are common to many other disorders; such are uneasiness or restlessness, watchfulness, languor, depression, headach, dryness of skin, loss of appetite, and constipation. A more characteristic affection than any of these, and which was first noticed, we believe, by Richerand, is an unusual and persevering extension of the limbs during sleep, the tendency in health being, as every one knows, to a state of semiflexion. The disease may be said to have commenced when the patient feels a stiffness about the back of the neck, sometimes extending to the occiput, and a dryness and soreness in the throat. These symptoms, though common to many disorders, excite immediate alarm in the minds of surgeons, when the individual who experiences them is under treatment for local injuries. A violent pain under the sternum is a very frequent concomitant. The next occurrence in the order of time is the closure of the jaws, which in some instances takes place with a sudden snapping contraction: in others it is preceded by a feeling of pain, stiffness, and weakness in the temporal and masseter muscles, and the parts approach by degrees, being at last so closely fixed that it is impossible to separate them. Even wedges and levers are of little avail, says Aretæus;† and, as he further remarks, if we succeed in separating the teeth, we gain nothing by so doing, for on attempting to pour liquids into the mouth, the patient is found unable to swallow them, in consequence of the spasm which has by this time beset the muscles of the pharynx; or if he does accomplish deglutition, the effort is often so convulsive and agonising, that he entertains the greatest dread of repeating it, to such a degree, indeed, that, like the sufferer in hydrophobia, he is sometimes distressed at the very sight of water. The teeth are not always in complete contact, so that a viscid ill-conditioned saliva may exude through the intervening space. Thus far we are in possession of the principal symptoms of trismus,‡ or locked-jaw, which differs

only from the other forms of the disease by the circumstance that in the latter the spasm occupies a greater number of muscles. This species is scarcely less formidable than the others with regard to its fatality, but it is probably attended with less pain than when the body is more extensively affected. As the disorder proceeds, a violent stabbing pain, occurring in paroxysms, is felt in the region of the diaphragm, and the trunk and extremities become variously distorted. The face is suffused with a dark red flush, and miserably disfigured by the perverted action of its muscles, which draw up the nose, wrinkle the forehead, and drag the angles of the mouth towards the cheek-bones in such a manner as to present one of the most frightful exhibitions of the *risus Sardonius*. The spasms about the muscles of the thorax gradually increase to such a degree, that respiration is performed with the utmost difficulty and anguish; we know of no form of dyspnoea more distressing to the beholder. This occurrence, however, eventually plays a very important part in the extinction of the sufferings by death. Although the contraction of the muscles rarely ceases so completely as to form an intermission,* there are occasional remissions. These, as it regards the mouth and jaws, only aggravate the horrors of the case; for it often happens, during a brief separation of the parts, that the tongue is convulsively protruded, and not retracted in time to escape the re-closure of the teeth,—an accident which is generally attended with profuse hemorrhage. Sometimes the teeth are shattered by the violence of the spasm. The eyes are for the most part rigidly fixed, and suffused with tears. To conclude this brief account of the muscular derangements, it may be remarked that the sphincters are variously affected; thus, the urine is sometimes discharged with great and sudden impetus during the vehement contractions of the abdominal parietes, at other times it is retained. The anus is in general most obstinately closed, though cases have occurred in which the contents of the rectum have been expelled involuntarily.

The mind, in the midst of all these sufferings, is perfectly clear, and occasionally even cheerful. Mr. Abernethy used to state in his lectures, that he had often known patients express themselves as feeling better to the very last. We have never happened to notice this fact, but can testify to the absence of the excessive sensibility and terror, which are present in hydrophobic patients. There is neither headach nor vertigo, and the senses are unimpaired. It is almost needless to mention that articulation is very feeble and indistinct, and frequently attended with such distressing aggravations of the spasms, that the sufferer, although fully possessed of his consciousness, remains silent.

The circulation is only secondarily affected by the violence of the muscular contractions. Such is particularly the opinion of Sir James

Originally this term implied a convulsive rather than a tonic spasm.

* In two of Dr. Parry's cases there were marked intervals.

* Mr. Guthrie has the merit of having been the first to draw the attention of the profession to the mild species as *contra-distinguished* from the acute.
† De Causis et Signis Acutorum Morborum, lib. i. cap. 6.

‡ From τριζω, “to gnash or grind the teeth.”

M'Grigor,* Dr. Hennen,† and many other accurate observers. There is generally, however, a progressive alteration of the pulse during the course of this as of almost all other maladies. At the beginning it is pretty hard and full, but towards the close it becomes more frequent and feeble, and often is irregular and intermittent. The heat of the skin also appears to depend on the violence of the paroxysms; it has been found by Dr. Fribo of Geneva as high as 110° Fahrenheit. The perspiration is generally profuse over the whole body, but sometimes is confined to the face and chest; it continues during the whole course of the disease, and has a peculiar pungent odour. The urine presents nothing remarkable as to quantity or quality; some describe it as always high-coloured,‡ while others have observed it to be quite as often unchanged. Torpor of the intestines, to a degree that resists the most powerful purgatives, is allowed by all who have witnessed the disease, to be a more invariable accompaniment than any other. Such dejections as are obtained are excessively offensive and unnatural.

At the end of twenty-four or thirty hours,§ in acute cases, the disease has so far advanced that the patient is unable to swallow. In the progress of the attack we often notice an apparent emaciation, the forms of the muscles become distinctly visible through the skin, and their rigidity increases. Towards the close, a spumous fluid, mixed up of mucus, blood, and saliva, escapes from between the teeth, the face is more and more distorted, a cold clammy exudation bedews the skin, the spasms are aggravated by the slightest exertion, whether for change of position, or to take food or medicine, the remissions are fewer, the dyspnoea increases, the pulse becomes thready or imperceptible, and death takes place on the second day, or may be delayed to the tenth.|| The most common period is within the fourth.¶ Hippocrates states in one place,** “that if the patient survives this day, he is pretty sure to recover,” an observation confirmed by the moderns; but in another place he tells us that the third, fifth, seventh, or fourteenth, may be the fatal day.†† Professor Robison, of Edinburgh, relates the case of a negro, who happened to scratch his hand with a piece of broken plate, and died of tetanus in a quarter of an hour.

It is the general opinion that death takes place in the way of asphyxia. We have no doubt that the obstruction of the respiratory movements accelerates the termination, but are inclined to think that the heart, enfeebled by

the long-continued agony, and perhaps involved in the prevalent affection of the muscular parts (according to the opinions of Parry and Howship), has at least an equal share in the production of the fatal result. There seems but little ground for Baron Larrey's notion, that the compression of the abdominal viscera, and the engorgement of the vessels of the brain, are importantly concerned in the catastrophe. But in whatever manner death is brought about, it is an event happy to the tortured patient, and gladly hailed by his friends. “Far less calamitous is it,” says Aretæus, “than the previous sufferings, in the estimation of the by-stander, even if he be the victim's own son or father!”

The most common variety of this disease is *opisthotonos*. All writers concur in this statement with the exception of Larrey, who seems to have more frequently met with *emprosthotonos*. The distinctive character of the former, as the name imports, is that the neck or the whole body is bent backwards. The posterior muscles of the neck are so rigidly contracted, that the head is dragged down upon the nucha and the larynx thrown forwards. In some cases there is no other incurvation, but more commonly the spastic action extends to the muscles of the spine, the effect of which is to draw the trunk into the form of an arch, the weight of the body being supported by the occiput, or rather by the vertex, and the sacrum. The inferior extremities are extended, and sometimes the muscles between the posterior parts of the pelvis and the thighs are so violently affected as to throw the pelvis upwards, and thus to produce a much wider arch. This action of the abductors is greatly assisted by the biceps semitendinosus and other flexors of the leg, which, by reason of the vigorous antagonism of the extensors, have their fixed points on the tibia, and their moveable ones on the pelvis.* So great is the stretch on the abdominal parietes, that they feel as hard as a board, and, according to Aretæus, are sonorous when percussed. The latter observation we have not verified by our own experience, but think it highly probable, inasmuch as the constriction of the sphincter ani must prevent the escape of air from the intestinal canal, notwithstanding its compression by the contracted parietes, and, consequently, the latter must afford a clearer sound when struck. The arms, in this form of the disease, are usually in a state of extension and drawn backwards, but occasionally they are bent, and lie upon the breast.† The fingers not unfrequently escape any spastic affection. During the remissions that occur in *opisthotonos*, we observe that the muscles on the anterior part of the body are not unaffected, but they are incapable of resisting their antagonists. The suddenness with which the re-curvation takes place has been sometimes so great as to project the unhappy patient from his bed.

†† De Morbis, lib. iii.

* The contraction of the femoral muscles was, in a case related by Desportes, so violent as to fracture the thigh-bones. See his “Histoire des Maladies de St. Domingo,” ii. 171.

† See one of Larrey's cases, op. cit. i. 242.

In a case related by Fournier-Pescay the spasms occasioned a dislocation of the second cervical vertebra.

Emprostotonos is a variety which has never occurred under our own observation; nor are we singular in this respect. Dr. Hennen, notwithstanding his many opportunities of observing the disease, never witnessed this form of it. The most striking descriptions of it that we have met with are those of Baron Larrey among the moderns, and of Aretæus among the ancients. The muscles on the anterior part of the body are said to be so contracted as to bend the head upon the breast, to curve the spine anteriorly, and to draw the thighs towards the belly. In very severe cases the head is brought into contact with the knees, so that the body presents the shape of a ball rather than of a bow, according to the remark of Aretæus. The condition of the legs is differently reported by these two observers; Larrey, in his general sketch of the symptoms, does not mention the extremities, but in one of his cases he states that "les jambes étaient roides, et fortement fléchies sur les cuisses."* Aretæus declares in one place that the legs are extended, and in another, that they are drawn forwards with such violence, that the knee-joint appears as if driven into the ham.† The arms are generally flexed, and the hands clasped together.

Pleurostotonos is still more rare than the variety just described. It consists in a lateral incurvation of the neck and body. It is generally met with in the chronic form, but we once observed it in an acute case that but for this complication would have been simple trismus.

The last variety to be mentioned is that to which, in strict verbal correctness, the word *tetanus* should be confined. It is tetanus proper, consisting as it does in complete extension of the whole body. The frame is so rigidly set that it is impossible to move one part without changing the position of the whole. Many writers treat of this variety as evidencing a balance between the flexors and extensors. This appears to be a correct observation so far as the head and the spine are concerned, because these parts are capable of motion in two directions. But when applied to the extremities the remark is incorrect, since the extension of these parts must be the result of the predominance of the extensors over the flexors. If there were a balance between the two sets, the position of the limbs must be intermediate to extension and the extremest degree of flexion; a position frequent enough in sleep and recumbence, when neither set is in action. Now, extension of the spine is a condition intermediate to that which the column would assume, if either of the sets of muscles on the anterior or posterior surface had the predominance, for, properly speaking, both kinds are muscles of flexion, though the posterior are said to be extensors, inasmuch as they keep the trunk erect by counteracting the tendency of gravitation to

incline it forwards; consequently, a rigid extension of the trunk may be correctly said to result from the equilibrium of the anterior and posterior forces, erroneously called flexors and extensors; but the same explanation is inapplicable to the limbs, because in them extension is produced by the extreme of one of the antagonist forces. From this remark we exclude the feet and hands, which are in the same predicament as the head and the spine, that is to say, are not subject, as is commonly described, to flexion and extension, but to flexion in two directions.

Before proceeding to the next subject of consideration, we may observe that the inferior animals are liable to all the above varieties. Dr. Mason Good speaks of parrots as being frequently afflicted with trismus. Horses are very commonly treated by veterinary surgeons for opisthotonos and tetanus. Dr. Parry appends to his treatise some cases related by Mr. Sewell, of Bath. In the *Revue Médicale* for May, 1834, there are some cases with the post-mortem appearances, reported by M. Gélée, Professor of Veterinary Surgery at Toulouse. Lambs are also subject to the disease. "I have often seen lambs," says Dr. Parry, "whose ears, for the purpose of marking them, have been bored with a red-hot iron too near the root, so rigid all over with tetanus, alternating with convulsions, that their bodies would project in a right line with their hind leg when one held them out horizontally by the hind feet."*

Causes.—Of the events which immediately precede that morbid state of the system which presents the phenomena above detailed, none are more common than mechanical injuries, and the application of cold, with or without humidity. With regard to the former, there is an entire concurrence of opinion among practitioners, that their efficiency as causes bears very little relation with their nature or degree. Every description of wound, no matter how inflicted, or in what part, or in what stage, may be the occasion of tetanic symptoms, which form the species denominated traumatic. Morgagni tells of a young lady of Verona, who was attacked with the disease in consequence of a bite on the finger from a tame sparrow.† Dr. Reid knew a case in which tetanus supervened on the mere stroke of a whip-lash under the eye, though the skin was not broken. Larrey mentions that a small fish-bone sticking in the pharynx was the occasion in one instance, and in another a slight solution of continuity in the external ear from a musket-shot. Andral alludes to a case that occurred at La Charité, in which the application of a seton to the thorax was the cause of fatal tetanus.‡ An instance is mentioned by Mr. Morgan in which the stroke of a cane across the back of the neck, and another in which a blow on the hand from the same instrument, produced the disease; in

‡ Clinique Médicale, t. iv. p. 445.

both the termination was fatal.* A reviewer of Dr. Reid's work on tetanus in the *Edinburgh Medical and Surgical Journal*,† states that the extraction of a tooth was once followed by this disease. According to Sir James McGrigor, "it occurs in every description and in every stage of wounds, from the slightest to the most formidable, from the healthy and the sloughing, from the incised and lacerated, from the most simple and most complicated."‡ Dr. Hennen observed, in like manner, that the wound, so far from presenting any unnatural appearance, would often pursue its course unaltered by the tetanic seizure; in one case he mentions that the cicatrization was completed on the same day that life terminated. Larrey, however, lays considerable stress on the condition of the wound, which he says was generally either dry, or covered with a thin serous exudation. One case that occurred after amputation he attributed to too early cicatrization, and the consequent "reflux des matières purulentes qui suintaient encore de la plaie."§ Dr. Rush speaks of an absence of inflammation in wounds that cause tetanus.|| Fournier-Pescay in like manner describes them as pale, livid, and affording either an ichorous secretion or none at all.¶ The instances already recited prove that the situations as well as the characters of the wounds are very various. When the predisposition is very strong, and collateral circumstances are favourable, the locality of the wound is almost a matter of indifference. But it would certainly appear that some wounds are more frequently followed by tetanic symptoms than are others. Hennen oftener observed these occurrences after wounds of the elbow and knee; many practitioners connect them with the extremities rather than with the trunk; and not a few speak of a greater liability to such symptoms from injuries of the thumb and great toe.** Mr. Samuel Cooper states that the only surgical operations which he has known to be succeeded by this disorder, are those of amputation and castration.†† It was an ancient opinion, and is still by no means extinct, that injuries of tendons and ligaments, more frequently than of any other tissues, lead to tetanus,—a notion which we think may have arisen from the confusion which prevailed in the early periods of anatomy respecting nerves and fibrous membranes. Few, however, would now be disposed to assert the existence of a necessary connection between the disease and fibrous tissue. Were it necessary to disprove such a view, the facts adduced by Parry would have considerable weight in the refutation. This physician knew a case in which a long thorn was driven entirely through the tendo Achillis, and remained five days,

producing no soreness in the part, but a pain in the ham; on suppuration being established, the thorn was extracted, and the patient felt no further inconvenience. "In the various experiments made by Haller, in order to investigate the sensibility and irritability of these parts, no bad consequence whatever ensued."* Blows on the neck have been noticed both by ancients† and moderns‡ as frequent causes of tetanus; and it is evident that such injuries act directly on the cerebro-spinal centre. For a more ample account of the tendency of certain wounds to induce the disease under consideration, we must refer to writers on surgery. But we may remark before quitting the subject, that although the presence of the disease is not fully announced till the appearance of soreness and stiffness about the neck and throat, it is not uncommon for the muscles in the neighbourhood of a wound to be spasmodically affected before any others become involved; sometimes indeed the patient escapes without any other sign of spastic disturbance.

Next in frequency to wounds, as an exciting cause, is exposure to cold and damp. There are indeed but very few cases of true idiopathic tetanus referable to any other marked exciting cause. Aretæus asserts the influence of a low temperature, and states that the disease is in consequence more common in winter than in any other season, and least frequent in summer, except as the effect of wounds or of a particular epidemic constitution. In tropical climates exposure to the chilly night air and dew is well known to be highly dangerous. The negroes in the West Indies are frequently affected with this complaint. But it is by no means confined to warm climates. Dr. Gregory, of Edinburgh, used to mention in his lectures a striking instance of idiopathic tetanus that occurred in Edinburgh. An account is given by Bonetus§ of a young soldier, who contracted the disease by sleeping in the open air a whole night in a fit of intoxication. Fournier-Pescay also reports the case of a soldier at Breda who went into a cold bath, when greatly heated, and on coming out was seized with fatal tetanus; and also of a woman who died in a similar manner, after falling into a river when in a state of perspiration, and during the flow of the catamenia. He frequently observed during the campaigns in Spain, that the soldiers, if they went to sleep upon the ground, after fatiguing marches under a burning sun, were particularly liable to tetanus. The cold and moist breezes from the sea have often produced the disease in hot countries. Many of the French soldiers were seized with it when marching along the coast, on their way from Acre to Jaffa. A sudden change from the heated atmosphere of a ball-room to the external air was sufficient to produce a very violent attack in a gentleman known to the author last cited.

§ Sepulch. lib. i. sect. 13.

But although wounds, and cold, and humidity are capable of producing the disease independently of each other, their combined action is infinitely more formidable. Many instances on record prove that the first of these would not have been followed by tetanus but for the intervention of the others, and that individuals have been placed under the most unfavourable circumstances with regard to cold, and yet have escaped the disease till the occurrence of an injury. Hennen lays less stress on the agency of cold than on that of air in motion; for all the cases which fell under his own observation had been exposed to a stream of air, either hot or cold. We think that the analogy of neuralgia strongly favours this view.

The irritation of worms has been regarded by some authors as the cause of tetanic affections. Laurent, of Strasburg,* went so far as to assert that even in wounded subjects the real cause was the presence of worms in some part of the alimentary canal. Dr. O'Beirne† is disposed to award them a very considerable agency in this disease. There can be no doubt whatever that worms have been frequently discovered in the intestines of tetanic patients; but we imagine that every attentive practitioner must have observed these animals too often and in too great a variety of morbid circumstances, to be very ready to invest them with any specific efficiency in so rare a malady as that which we are considering. It is highly probable that the same state of the system which favoured the generation of worms, may have facilitated the operation of the proximate cause of tetanus. The following instance of alleged verminous action was communicated by Chaussier to Fournier-Pescay. A young man, after labouring under severe pain in the bowels and constipation, was attacked with tetanus, which yielded however to the free use of purgatives, under the operation of which an enormous worm was expelled. This animal was considered to have been the cause of the disease, notwithstanding the patient had received a sword-scratch on the ribs some days before.‡

Terror has been considered the immediate antecedent in some cases, and sympathy in others. This we have on the authority of Dr. Hennen, whose observations were far too accurate to be called in question. Dr. Willan mentions a case in which there had been no local injury or other accident, and in which the only circumstance that could be fixed upon as the cause of the attack, was mental anguish; it should be added that the constitution of this individual had been previously weakened by other causes.§ The Greek author, to whom we have so often referred, intimates that women are very subject to the disease after abortion. We are not aware of any modern observations in support of this opinion. We remember, however, attending a young woman, who was seized with locked-jaw soon after delivery of a

still-born and immature fœtus; but the affection readily gave way to a turpentine injection, and we looked upon it as a mere sympathetic accident. The sudden suppression of perspiration has been known to bring on an attack. Such was the case with a woman, who, while labouring under a gastric fever, exposed herself at an open casement to the north wind.* Heurteloup† relates a case in which the attack was apparently brought on by an accumulation of cherry-stones in the intestines. Other exciting causes may be found in the works of various authors; such are suppression of the lochia, alcoholic intoxication, acute diseases, as variola, typhus, and gastric inflammation. Of the last of these an example will be given in another place. Fournier-Pescay adduces some curious cases communicated to him by M. Duval, in which the disease assumed the form of anomalous ague; in one of them it was remarked that both sides of the body were never affected in the same paroxysm, but regularly alternated in successive fits.

Various causes may be traced in the body itself prior to the occurrence of the immediate and efficient agent. The state of the system peculiar to certain ages has been commonly enumerated as one of them; but we doubt whether any thing very definite upon this subject can be gathered from the cases on record, if we except the liability of young infants; in consideration of which nosologists have established a variety known by the name of trismus nascentium. Instances of this variety have been met with principally in tropical climates, and particularly in the West Indies. Dr. Cullen, however, speaks of its having been witnessed in the Highlands;‡ and Fournier-Pescay and Dagille bear testimony to its occasional occurrence in France. It happens for the most part within the first two weeks after birth, and is supposed to depend on irritation of the primæ viæ by meconium, worms, unnatural secretions, &c. or on a morbid condition of the umbilical fossa. According to one practitioner,§ cases of the disease became very rare under the prophylactic use of purgatives, while another|| states that attention to the umbilicus produced almost certain immunity. With regard to sex, the ancients considered females to be more frequently affected with tetanus than males, but less severely. We may take it for granted that in this remark they included certain irregular spasmodic affections incident to nervous and hysterical women. Males have been by far the most frequent victims in recent times; but this fact is perhaps more naturally explained by their being oftener subjected to such exciting causes as cold, vicissitudes, injuries, &c. than by their peculiar constitution.

The predisposing influence of warm climates and seasons has been matter of very general remark. One of the most striking illustrations

|| *Dr. Colles*, *Dub. Hosp. Rep.* vol. i.

of this influence is given by Dr. Rush. After mentioning the frequency with which wounds were succeeded by tetanus if the weather had been previously very warm, he relates, on the authority of some French surgeons, that at the siege of New York in 1781, some troops which had arrived just before from the West Indies, were the only persons that suffered from the disease in question, and that not a single case occurred among the soldiers who had passed the previous winter in Rhode Island. This acute physician attributed the effects of the warm atmosphere to its relaxing tendency, and points out its analogy in this respect with other predisposing causes, particularly laborious exertion. He also explains the particular liability of wounds received in battle to tetanic consequences, by the fatigue which soldiers generally undergo before engagements.

Humid situations also produce a very decided predisposition to this disease. We are informed by Larrey that great numbers of the wounded soldiers in the hospitals at Cairo perished of tetanus, which he attributed to the circumstance that those receptacles were erected upon ground subject to the periodical inundation of the Nile.

Bad or insufficient nutriment, close and ill-ventilated habitations, inattention to cleanliness, neglect of the bowels, &c., have been considered as predisposing causes; views which derive no little probability from the diminished frequency of the disease in our naval department in the West Indies, since the improvements which have taken place in their hygiene. The experience of Drs. Dickson and M'Arthur* was a very striking contrast to that of Dr. Lind. The latter states that five out of six cases of amputation used to die of tetanus; while Dr. Dickson reports that during seven years he met with only six cases of the disease occurring after amputation; and Dr. M'Arthur, who had the care of the naval hospital in Barbadoes, had witnessed only two cases in that institution during a space of six years, notwithstanding there was no lack of wounds, either from war or from surgery. Dr. Dickson concludes a very interesting paper with the following remarks:—"I trust I am, therefore, justified in inferring that to the improvements in the medical and surgical treatment of wounds, in cleanliness and ventilation, avoiding at the same time exposure to currents of cold air or sudden changes of temperature; in fine, to superior comforts, diet, and accommodation, but particularly to the greater attention paid to the state of the bowels, may be attributed the great infrequency of tetanus of late in the West Indies, when compared with former wars."†

Whether the comparative infrequency was entirely due to these causes, might perhaps admit of some question, as there is reason for believing that there are latent causes of tetanus, the removal of which might, consequently, have escaped observation; such causes, for instance, as are concerned in the limitation of the disease

to particular districts, towns, streets, and even hospitals, notwithstanding they may be apparently in the same circumstances as other situations.*

Prognosis.—This is mainly to be determined by the nature of the exciting cause, and by the type of the seizure. With respect to the former, it is sufficient to remark that the greater mortality of the *traumatic* species, so well known to the earliest observers in our art,† is matter of equal experience in modern times. Dr. O'Beirne witnessed two hundred cases in the peninsula, not one of which recovered.‡ That the idiopathic disease is a far milder and more tractable affection "is a fact well known," says an able writer in the *Edinburgh Journal*,§ "to every planter in the West Indies, who never considers his negroes as safe when the disease supervenes on a wound, but is frequently successful in alleviating the idiopathic species." The type of the disease as acute or chronic is a no less important guide as to the probable termination. Hennen confesses that he never saw a case of "acute symptomatic tetanus" recover. In the acute species Dr. Dickson found all curative measures followed by "unqualified disappointment." Mr. Morgan's testimony is still stronger; he says, "I have never yet seen or heard of an instance of recovery from acute tetanus."|| Many other authorities might be quoted to the same purport. The chronic species has acquired the additional character of mild, but the period at which the disease becomes chronic has not been sufficiently specified. "The disease which comes on suddenly," says Cullen,¶ "and advances quickly to a violent degree, is always more dangerous than that which is slower in its progress." If the patient survives the fourth day, there are good hopes of his recovery; not but that death may occur at a much later period. A patient of Prof. Cooper's lingered five weeks, and then died; but instances of a fatal termination after the lapse of a single week are extremely rare. The complaint may continue for many months in a chronic form, and then gradually wear away. It will be seen that a great proportion of the remedies which have got the credit of utility in tetanus, have been indebted to their application to this form of it. A prognostic observation made by that distinguished physician, Dr. Parry, respecting the state of the pulse, has been often quoted. "If, in an adult, the pulse by the fourth or fifth day does not reach 100, or perhaps 110 beats in a minute, I believe the patient almost always recovers. If, on the other hand, the pulse on the first day is 120 or more in a minute, few instances will, I apprehend, be found in which he will not die."**

To us it appears that this remark does

not by any means deserve the degree of notice that has been taken of it; for in the first place the author bases it upon an opinion altogether hypothetical respecting the affection of the heart in this disease; secondly, those who have had the most frequent opportunities of observing the disease, consider the circulation, as we have already stated, to be only secondarily affected by the spastic commotions of the system; and, lastly, if the observation be correct, it teaches us little or nothing additional, for if the patient lives till the fourth or fifth day to have his pulse examined, be it slow or frequent, there are good reasons for a favourable prognosis. Perhaps any considerable frequency of the pulse at the very commencement, may be justly esteemed a sign of severity, and likewise any remarkable smallness or irregularity; but in such a case there would be other symptoms far less equivocal. Baron Larrey formed an opinion that perspirations in certain parts were critical, those, namely, about the chest and abdomen, while those beginning on the head and extremities were symptomatic only. We are not acquainted with any other authority confirmatory of this opinion.

Diagnosis.—The features of this disease are so striking and peculiar, that they cannot be very readily confounded with those of any other. If the muscular affection be not sufficiently characteristic, there are, the peculiar pain at the lower part of the sternum, the state of the tongue, and the absence of delirium or coma. In consequence of the difficult deglutition produced by the spasms in the pharynx, and the occasional dread of fluids, taken in connexion with the aggravation of the disease by trivial excitement, a superficial observer might possibly imagine that he was witnessing a case of hydrophobia. The differences are very decided, but we shall not stop to detail them, as they have already been set forth in a very ample and lucid manner by Dr. Bardsley, in the article on *HYDROPHOBIA*, in this work. It is necessary to be aware that hysteria, which imitates so many formidable diseases, does not allow tetanus to escape her mimicry. Sometimes the representation is so faithful, that we have not the slightest doubt that many reputed examples of successful treatment of tetanus have been merely conquests over hysterical spasms. Dr. Whytt, in his work on Nervous Diseases, alludes to these occurrences; and there is a well-marked case of the kind in Mr. Tate's Treatise on Hysteria. But it is needless to refer to authorities, since no practitioner of even ordinary experience can have failed to observe spasmodic affections in irritable females, closely bordering upon what we have just alluded to. There is sometimes a locked-jaw from mere local inflammatory causes, which might perhaps be mistaken for a tetanic trismus. We have frequently witnessed it in inflammatory swellings of the face and fauces, in the tumefaction attendant on mercurial ptyalism, and in rheumatic affections of the temporal and masseter muscles. In one instance of the latter kind, which fell under our notice, the jaws had been fixed at an

interval of barely one quarter of an inch for the space of three months. The history of such cases, and a variety of concomitant circumstances, will render their discrimination easy.

The diagnosis of spontaneous from artificial tetanus, or that produced by certain poisonous substances, is somewhat more difficult. The effects of nuxvomica, the upas tiente, and other plants belonging to the genus strychnos, and of their active principle strychnia, are precisely similar to tetanus, both as it regards the peculiar nature of the spasms, and the absence of any mental disturbance. The discrimination, however, of such cases is highly important in many points of view, and must be sought in a careful examination of the previous history, of the progress of the case, and of a variety of collateral circumstances. In a temperate climate a sudden accession of tetanic symptoms of great severity, and running their course rapidly, in a person who has received no local injury, nor been exposed to cold and damp, would create a strong suspicion of poisoning. Supposing their character were somewhat milder, and their progress more tardy, the presence of certain signs of irritation in the alimentary canal would materially assist our diagnosis, since we know that the substances alluded to not only act on the nervous system, but are also decided irritants,—that, in short, they belong to the class of narcotico-acrids.

Accession.—The period of accession differs in the idiopathic and traumatic species, being in the former considerably earlier. When arising from exposure to the cold and damp of the night, the disease usually makes its appearance on the following morning. After injuries its appearance is generally, though not always, later. This difference is perhaps more apparent than real, for in the latter case, although we date from the infliction of the wound, which is the obvious cause, it would be more correct, were it possible, to reckon from that change, or from the commencement of that state of the wound which is really the cause of the distant irritation, and then in all probability there would not be observed the same protracted interval between the occurrence of the cause and of the effect. But this refinement, we confess, is of little practical importance, the great object being to ascertain how soon an individual who has suffered an injury may be pronounced secure from an invasion of tetanus. The most common period for the first appearance of the symptoms is during the second week. Sir James M'Grigor states twenty-two days to be the longest period.* Sir B. Brodie† mentioned on one occasion that the seventeenth day was the latest at which he had known invasion take place. Sir Gilbert Blane, in his work on Diseases of Seamen, gives a range of four weeks. Fournier-Pescay declares that he has known it occur at a period longer than a month, and, on the other hand, that in some very rare instances only a few hours have elapsed. We have already alluded

* Med. Chir. Trans. vi. 453.

† See a Clinical Lecture in Med. Gaz. vol. ii. p. 344.

to a case in which the disease not only took place, but was fatal in a quarter of an hour after the injury.

Morbid anatomy.—Though little if any thing of value is to be gathered from the researches which have hitherto been prosecuted in this department, it would be highly improper to pass them altogether without notice.

In the dissection of a case related by Bonetus, there was found nothing preternatural in the organs of the thorax and abdomen, but the ventricles of the brain were filled “*materiâ quâdam viscidâ ac glutinosâ, colore luteo, vitello ovorum perquam simili sed fœtidâ admodum.*” He adds, “*Hæc incumbens principio nervorum tam sæva symptomata in subiectis partibus excitârat. Venæ intercurrentes utramque cerebri meningem, admodum turgidæ erant bilioso sanguine.*”^{*} Morgagni relates the appearances in three cases of tetanus. In one there was some venous congestion in the thorax, neck, and head, with more vascularity than natural of the medullary matter of the brain.† In another there was a somewhat larger quantity of serum than usual in the ventricles of the brain; the cerebrum was firm in tissue, but the cerebellum rather soft.‡ The third presented no morbid appearances, excepting a very little serum in the left lateral ventricle.§

In recent times particular attention has been directed to the appearance of the spinal cord. Dr. Reid, in his work on Tetanus, describes what he considered to be an inflammatory condition of the membranes, with or without the effusion of serum. Similar appearances had previously been mentioned by Bursarius, who observed them in the case of a man who died of the disease after exposure to cold in a state of intoxication. Fournier Pescay, who, while serving in the army, never neglected an opportunity of dissecting the bodies of those who died of tetanus, states that fluid blood was often found effused between the dura and pia mater, that the vessels of the latter membrane were gorged with blood, and that the cerebral substance was depressed. He makes no remark on the state of the spinal cord.|| Rochoux cites Trnka and other authorities in testimony of similar facts.¶ The periodicals of the last twenty years furnish several cases in which morbid appearances were said to be found in the spinal cord or its envelopes.** But since anatomists have learned to place less reliance upon mere redness and turgescence as indications of inflammation during life, the profession have become less and less satisfied as to the constant presence of morbid changes in the spines of tetanic patients.

Of the cases communicated to Hennen many presented the cord and its membranes in a perfectly natural condition, and he had reason to suspect that the apparent lesions of these parts were often due to the rude use of the chisel and saw. The unskilful mode in which we have often known the operation of exposing the contents of the vertebral column performed, leads us to consider this author's conjecture a very probable one. Sir B. Brodie could never satisfy himself that these parts were diseased.* Dr. Elliotson considers the appearances described to be rather incidental than essential;† and Mr. Morgan, after mentioning that in some cases cerebral congestion and increased vascularity or morbid deposits in the spinal membranes have been discovered, declares that in other cases he has looked in vain for the same appearances.‡ The following passage in a lecture delivered by Professor Mayo at King's College has just caught our attention. “In the museum of St. Thomas's Hospital, I am informed by Mr. Green, there are two specimens of the spinal cord, the membranes of which are studded with little cartilaginous and earthy flakes, taken from patients who died of tetanus. These small deposits did not, it is to be presumed, produce the tetanus, but they probably had made the spinal cord preternaturally irritable.”§

Baron Larrey states that he often found the pharynx and œsophagus in a state of constriction, and their mucous membranes inflamed, and covered with a viscid reddish-coloured secretion;|| appearances which it is more reasonable to attribute to the violent action in these parts, than to consider as concerned in the pathology. Some observers have thought that they recognised the effects of inflammation in the stomach and intestines, but they do not specify any thing more than such alterations of colour as are often the result of cadaveric changes. We except from this remark a case related by Andral,¶ in which dissection presented very unequivocal signs of gastritis; but this was evidently the *exciting* not the *proximate* cause of the attack. This distinguished pathologist conjectures that the patient must have had a very strong predisposition to the disorder, and that any lesion would have produced the seizure. Dr. M'Arthur found in his dissections a very peculiar appearance in the contents of the alimentary canal, particularly in the stomach. In one case “the villous coat of the stomach was covered with a peculiarly offensive smelling yellow matter;”*** the mucus in the œsophagus was of the same colour; and in another case, “the yellow fluid effervesced on coming in contact with the external air.”†† Fournier Pescay also speaks of a yellowish or greenish

coloured mucosity found in the stomachs of some of his patients. Worms, we have already mentioned, have been frequently found in the intestines; they are particularly taken notice of by Morgagni, Stoll, Larrey, and Dr. O'Beirne.

Anomalous appearances have been observed in other parts of the body. A writer in the *Edinburgh Medical and Surgical Journal** quotes from Meyer a case in which there was discovered an ossification of the pleura, which must have irritated the phrenic nerve; and one from Vater in which the par vagum was irritated by an ossified gland. The heart was found to be preternaturally contracted, so as to occasion considerable resistance to the knife, in a case related by Mr. Howship.† Mr. Swan, in his treatise on tetanus, details some dissections in which he discovered inflammation of the abdominal ganglions. It must not be omitted, that in many cases of the traumatic species, the nerve in the neighbourhood of the wound has been found inflamed and thickened, while in others nothing unnatural could be detected.

Theory.—Upon the above post-mortem appearances it may be remarked in general terms, that they are by no means constant; that they vary in degrees that hold no correspondence with the difference of the cases; that many of them are accidental accompaniments; and that with regard to others it is extremely doubtful whether they are actual morbid lesions or mere cadaveric alterations. Consequently, upon facts of this description it would be absurd to attempt to erect any theory of the disease. Unassisted by morbid anatomy, the speculator is reduced to the data afforded by physiology and by the symptoms; and he is not likely to be questioned if he pronounces that the malady belongs essentially to the nervous system, whatever other be secondarily affected. He is baffled, however, in his attempts to explain the rationale of the derangements in tetanus, and must confess with the candid and enlightened Abercrombie, that “its pathology is still involved in great obscurity.”‡

That the pathology of any of the neuroses should be obscure, when so little is known of the instrumentality of nervous matter, can excite no rational astonishment. But in some of the diseases belonging to this class, there are states of the organization which shew clearly enough that the mechanism was impeded or in a preternatural condition, though the action of the mechanism and the manner of its obstruction are entirely withdrawn from our observation. Thus we often find extravasations of blood, the products of inflammatory secretion, changes in the membranes, morbid states of the tissue, consisting in ramollissement, induration, adventitious growths, &c.; but these appearances are valuable to us, not because they explain in what manner the function was impeded, or in other words what

alterations took place in the arrangement of the ultimate nervous molecules, but because they are connected with certain conditions of the system less or more under the controul of our art. Such lesions, however, belong to a few only of the circumstances which are necessary to the proper performance of the nervous function; and in the nervous matter itself there may be myriads of other conditions, owing no connexion with any that are subject to our cognizance, but the disturbance of any one of which may be amply sufficient to occasion a fatal derangement. The imperfect pathology of epilepsy, chorea, mania, hysteria, hypochondriasis, &c., affords but too many illustrations of the truth of these remarks; and a still more striking testimony is borne by the autopsies of hydrophobia, and, as we have seen, of the scarcely less formidable disease under consideration. In all these instances, presenting no constant alterations of capillaries, of texture, or of secretion, we are forced to believe that the essential morbid change, whatever it be, must exist in those parts or actions of the mechanism which lie beyond our perception.

Many conjectures have been thrown out as to the division of the nervous system which is more particularly involved; but the prevalent opinion (which originated with Galen) is, that the spinal cord is the principal seat of the disease; an opinion founded upon the idea that this organ is the primordial agent of voluntary motion. Fernelius is very confident upon this subject—“*Hujus morbi causam et vitium in spinæ initio contineri extra controversiam est.*”* The same opinion, we are told by Dr. Abercrombie, was entertained by Hoffmann, Ludwig, Lieutaud, Burserius, and Belfingerus. The absence of any derangement of sensibility or of intellect in tetanic patients has led most observers to the conviction that the brain is not involved; but others, and among them Fournier-Pescay, fancy that this organ cannot be said to be free from disorder, inasmuch as the spastic action extends to muscles which derive their nerves from within the cranium. This doubt, however, cannot weigh with those who believe that all the cerebral nerves, as they used to be called, are capable of being traced into the medulla oblongata, or at least into its superior prolongations. On the other hand, it cannot, we think, be maintained that the disease is confined to the spinal cord. The early symptoms, namely, the stiffness about the throat, and the spasms of muscles supplied with nerves from the medulla oblongata, prove beyond all question that this part is first affected, and that in simple trismus there is no reason to think the cord at all implicated. Whether in more general tetanus the spasms are primarily excited by irritation of the cord, or of some remoter organ, cannot be fully determined till the physiology of these organs is better established. The possibility of the spasms being originated in the medulla spinalis may, we think, be fairly deduced, were other proofs

* Vol. xv. p. 289.

† Lond. Med. and Phys. Journ. vol. xxiv.

‡ Disease of the Brain and Spinal Cord, p. 396.

* Pathologia, lib. v. cap. iii.

wanting, from the experiments of toxicologists. Thus Professor Emmert of Bern found that on inserting the extract of false *Angustura* bark into the hind leg of an animal, after its spinal cord had been severed at the loins, the hind-legs as well as the fore-legs were thrown into spasms; and also, that if the medulla oblongata be cut asunder, and respiration artificially preserved, universal spasms might be produced by the introduction of the same substance.* But the researches of Flourens and Magendie prove that the cerebellum is so importantly concerned in muscular motion, that it would be wrong to leave this organ out of consideration, when reasoning upon the seat of such a malady as tetanus; a conviction rendered still more forcible by a case related by Orfila and Ollivier of poisoning by *nux vomica*, in which there was "found much serous effusion on the surface of the cerebellum, and softening of the whole cortical substance of the brain, but especially of the cerebellum."†

One of the most laborious and ingenious inquirers into the functions of the nervous system, Dr. Bellingeri,‡ attempts not only to determine the seat of tetanus, but to describe the limits peculiar to its separate varieties. Thus, as he supposes the motions of extension to depend upon the cerebellum and the posterior strands of the spinal cord, while those of flexion originate in the anterior strands and in the cerebrum, the former parts must in accordance with this hypothesis be affected in *opisthotonos*, and the latter in *emprosthotonos*. The reception of this explanation will depend on the estimation in which the Italian professor's doctrine of nervous antagonism is held; but we have no space for a discussion of its merits.

Treatment.—In this division of our subject we regret that we can do little more than recount a series of defeats, incurred by almost every therapeutical agent that has been employed against the terrible malady under consideration.

Opium has been more extensively resorted to than almost any other remedy; and certainly some of its well-known qualities are calculated to excite considerable expectations of benefit from its administration in a disease of which spasm is the most formidable symptom. Some practitioners have fancied that their anticipations have been realized, and have published cases in corroboration of their good opinion of this medicine. But a careful scrutiny of these histories tends very little to alter the unfavourable estimate which our own experience has compelled us to form of its virtues in tetanus, for they nearly all appear to have been instances of the milder form of the disease. We have known half-ounce doses of the tincture administered at brief intervals in acute

cases, and not the least impression made on the system. In some instances, when stupor has been produced after immense doses, there has been any thing but a remission of the morbid action of the muscles; and the observation of cerebral diseases constantly shews us that coma and spasms are by no means incompatible. There are several cases on record proving the enormous quantities that may be administered with impunity, though not with benefit. It is right to mention, however, that under the treatment of Dr. Gloster of St. John's, Antigua, a negro who had contracted the disease from exposure to cold at night, recovered after taking the drug for seventeen days, and the greater part of that time in doses of twenty grains every three hours.* Mr. Abernethy once found 3xxx of solid opium undissolved in the stomach. Systematic writers uphold the employment of the medicine, but it would appear for theoretical rather than for practical reasons, while those who give the results of their own experience express the greatest dissatisfaction with the remedy. Among the latter we find the distinguished names of Rush, McGrigor, and Fournier-Pescay. The strongest testimony in its favour that we have met with, is that of Baron Larrey; † he was in the habit of exhibiting it with camphor and nitre in emulsion of almonds, in which combination he found it most easily swallowed. Dr. Latham was very partial to its use in combination with *ipecacuanha*. There are on record three cases by Professor Mursinna of Berlin, treated with opium, in doses of from fifty to one hundred drops of the tincture every hour. ‡ They all recovered; but it is scarcely necessary to add that they were all idiopathic and apparently mild.

Bleeding, one of the most powerful of our antispasmodic resources under certain circumstances, has been the subject of some diversity of opinion, as to the propriety of its employment in tetanus. Few, however, are averse to it in the very beginning of the attack. The best guide in this as in many other diseases is the constitution of the individual; in some habits we have not the least doubt that it would aggravate the violence of the disease.§ There is not the least evidence to prove that it has any directly curative effect on tetanus; and if it exerts any beneficial influence, it is only as a preparative or auxiliary to other measures. Dr. Dickson advises its use as a preventive of the traumatic species, when the wound is inflamed and swollen, and the habit plethoric.|| Mr. Earle found it a very useful palliative in a case which ultimately terminated in death. In one of the successful cases related by Hennen, venesection was one of the measures em-

§ Dr. Cullen says, "Bleeding has been formerly applied in this disease; but of late it has been found prejudicial, excepting in a few cases, where, in plethoric habits, a fever has supervened."

|| Med. Chir. Trans. vol. vii.

* Christison on Poisons, p. 761.

† Christison, p. 757, quoted from Arch. Gén. de Méd. viii. 18.

‡ A very good abstract of this author's doctrines is given in the Edin. Med. and Surg. Journ. for Oct. 1834 and Jan. 1835.

ployed, but the case was confessed to be chronic. Larrey speaks favourably of the measure, and Sir James M'Grigor, though it appears in his catalogue of remedies that had generally failed, seems disposed to recommend it for want of a better resource. Perhaps, in the present state of our knowledge, the most that we can say for the measure is, that till we are better acquainted with the pathology of the disease, it would be scarcely justifiable to lose sight of a remedial agent, of which experience, independently of theory, shews us the utility in a very extensive range of diseases, and which is known in some complaints to exert a most powerful controul over symptoms which constitute the severest part of the malady under consideration. It is almost superfluous to hint that great caution must be used in the application of the remedy, as the production of syncope might be immediately fatal. No better rule can be devised than that of Aretæus: "ἰσάπαξ ἀφαιρέειν, εὐμέτρως, μὴ μέχρ' λειποθυμίας καὶ πείρῃ ἵδριος."^{*}

The warm-bath would for obvious reasons occur to the mind of any practitioner who had had no previous experience of the disease, and there is a certain amount of testimony in favour of its employment, but the majority of observers have rather relinquished it as useless, or condemned it as prejudicial. Among the latter was Dr. Hillary of Barbadoes. The cold-bath has had strong recommenders, particularly Drs. Lind and Currie. The latter, in his Medical Reports,[†] gives the case of a young soldier, in which immersion in cold water, after being pushed to the greatest possible extent, was quite successful; but after reading this case, we are disposed rather to think of the singular good fortune that prevented the patient from dying in the middle of the experiment, than encouraged to adopt it in our own practice. Sir James M'Grigor pronounces the measure to be "worse than useless;" and Dr. Parry's testimony is scarcely less condemnatory.[‡] We remember a case in which it greatly aggravated the violence of the spasms. Mr. Morgan relates an instance that occurred in St. Thomas's Hospital, in which a tetanic patient was plunged into a cold-bath at his own request—"All the symptoms disappeared in a moment, and he was almost immediately taken out of the bath—but he was taken out lifeless."[§]

Cold affusion has the warrant of very ancient authority. Hippocrates prescribes it in the idiopathic species, but strictly limits it to cases of this kind.|| In other cases, he advises warm fomentations and inunction.¶ Schenckius records two instances of successful treatment by cold affusion.** The most earnest of the modern recommenders of this measure are Drs. Wright and Currie. The former,

in a paper which was published in the London Medical Observations, detailed its good effects in the West Indies. The latter adduces two cases in which it was used in conjunction with other remedies, and which recovered; but they were both of the chronic kind. Latterly there has been but little experience of its beneficial operation.* It has been tried upon animals affected with tetanus and failed; there is a ludicrous account of its unsuccessful application in the case of a horse, in one of Mr. Abernethy's lectures;[†] and Dr. Parry states that it was quite useless to some lambs which were suffering from the disease. Dr. Elliotson relates an instance in which, after a pail or two of water had been dashed upon a tetanic patient, he fell down dead as if shot. In connexion with this subject we shall introduce a curious case, narrated by Sir James M'Grigor, of a soldier who recovered, apparently in consequence of exposure to wet and cold. "The symptoms of the disease occurred from a slight wound of the finger, and are stated to have been unusually severe. As it was impossible to think of leaving the man in the wretched village where he was attacked by the disease, he was carried on a bullock-car after the battalion. During the first part of the day he was drenched with rain, the thermometer standing at 52°; but after ascending one of the highest mountains in Gallia, the snow was knee-deep, and the thermometer below 30°. The patient was exposed to this inclement weather from six o'clock in the morning till ten at night, when he arrived half starved to death, but perfectly free from every symptom of tetanus."

Among the measures directed immediately against the spasms, we may mention tobacco in the form of enema, strongly recommended by Dr. O'Beirne, in consequence of a case apparently cured by the use of this substance.[‡] In the Peninsula, "when tried in the advanced stage, it seemed to have no effect;" (M'Grigor.) Musk is extolled by Fournier-Pescay, who boasts of having been the first practitioner who had treated with success an acute traumatic specimen of the disease. His dose was ten or fifteen grains; and he often gave two drachms in the course of the day. Ammonia is mentioned by the latter author as having been very efficacious in the hands of M. Francois. Oil of turpentine has been lauded for its power of relaxing the spasms in certain cases of locked-jaw, but they appear to have belonged to the milder species. We have already mentioned an instance that fell under our own observation.

Dr. Rush, believing the diathesis in which the disease occurs to be one of debility and relaxation, administered wine and bark with a liberal hand, and not without success. Others have confirmed his opinion of these remedies,

at least in the chronic species. In a case of this description, which lasted forty-two days, Dr. Currie administered one hundred and ten bottles of port wine.* Some authors advise ardent spirits in large quantities, and one of them goes so far as to advise us to produce intoxication, but this is no easy matter. It is scarcely less difficult in tetanus to intoxicate with alcohol, than to induce stupor by opium.

Mercury has been tried both externally and internally, and generally failed; the same insensibility being manifested in the system to the peculiar operation of this medicine as of those just mentioned. The indication for its employment is by no means obvious, and we are inclined to believe that the principle which first suggested the use of it, was that of exciting a commotion in the body, which in some way or other should render it a less convenient habitation for the disease; a principle upon which, however much they may be ashamed to confess it, practitioners have been but too often compelled to act. Among those who speak most favourably of this medicine is Dr. Rush, and apparently in consequence of his notion that it has a tendency to create a tonic diathesis.

The following is Sir James M'Grigor's summary of experience respecting the remedies which we have mentioned.

"The remedies which have been chiefly trusted to for the cure of this formidable disease are opium, mercury, wine, warm and cold-bath, venesection, ipecacuanha, and digitalis in large doses, enlargement of the original wound, and amputation of the limb. These have been tried alone and in various combinations, and I am obliged to confess that the whole failed in almost every acute case of tetanus which occurred. The three first have been administered in unlimited doses without effect; the cold-bath is worse than useless."

Dr. Elliotson, encouraged by the success which he had met with in the treatment of chorea and other neurotic affections by the sub-carbonate of iron, was induced to exhibit this substance in three cases of tetanus, two of which recovered.† The doses were from ʒij to ʒiʒ every two hours, administered in treacle. He is said to have stated in a lecture delivered at the London University, that a gentleman in the West Indies had been very successful with the same remedy since the publication of the above cases.‡

If there be one class of remedies on which we should be inclined to put more reliance than on another, it is that of purgatives, both on account of the obstinate costiveness which attends the disease, and because we have in daily practice such convincing proofs of their strong revulsive influence on diseases of the cerebro-spinal centre. Hamilton and Abernethy, the chief advocates of this treatment, founded their expectations of its efficacy less upon the principle of counter-irritation than on their views as to the frequent origination of

the disease in depraved conditions of the abdominal secretions. M'Grigor and Hennen consider purgatives to be some of the most hopeful of our remedies. The quantities required in some cases to produce any effect are all but incredible. In a case related by Dr. Briggs* the following quantities were administered: "The quantity of medicine taken from first to last is certainly very large, amounting, as far as can be ascertained, for the first twenty-five days, to calomel gr. 320, scammony gr. 340, gamboge gr. 126, powder of jalap ʒv. and ʒviiss, infusion of senna, with tincture, lbʒʒ, colocynth pill ʒiiss and gr. 45; of which the greatest part was taken within the first week, namely, calomel 280, scammony 260, gamboge 110, jalap ʒiij, gr. x., infusion lbʒʒ. The quantity given in little more than forty-eight hours, from the morning of the seventeenth, is perhaps unprecedented in this country, amounting to, scammony gr. 210, gamboge 89, jalap ʒj. and ʒiv., infusion lbʒʒ., colocynth gr. 80, and all this without causing either sickness or griping, but, on the contrary, with the most decided benefit."

Mr. Morgan, utterly dissatisfied with all the attempts that have hitherto been made towards the cure of the disease in its acute form, proposes to introduce into the system a substance which has the property of producing on the nervous system a condition directly opposite to that which is developed in tetanus, namely, paralysis. In support of the propriety of this plan, he adduces some experiments on animals, in which the artificial tetanus induced by inserting into the wound a poison called "chatic," and obtained from Java, was removed or abated by the counteraction of ticunas, a North American poison.† We are not aware whether this able surgeon has followed up his experiments by trials on the human system, but we quite coincide with him in the opinion that it is incumbent on us to look about for new remedies since the old ones have all failed. Upon this ground we are disposed to suggest a trial of strychnia; not that we have become followers of Hahnemann, but that it is a simple and undeniable fact that disorders are occasionally removed by remedies which have the power of producing similar affections. It is quite unnecessary to explain this fact by an arbitrary principle, that an artificial irritation excludes a spontaneous irritation of the same kind. A more rational ground for an expectation of benefit from homœopathic medicines may be found in the consideration, that such agents prove by their occasional production of symptoms like those of the disease to be treated, that they act on the part which is the seat of that disease, and consequently that there is a probability that in their operation on that part, (whether it be in a sufficient degree to produce a similar disease or not,) they may effect a beneficial change. Oil of turpentine, for instance, having been known to produce a discharge of bloody urine, might be rationally administered

* Med. Reports i. 148.

† Med. Chir. Trans. vol. xv.

§ * Edin. Med. and Surg. Journ. vol. v. p. 149.

† Op. cit.

in a case of spontaneous hæmaturia, not because it has a tendency to produce this disorder, but because that tendency shews it to have a specific action on the vessels from which the hemorrhage takes place. As to the dangers incurred in the experiment which we propose, we think it sufficient to say with an old writer, "Satiùs est aliquid nonnullà fiducià, vel cum periculo facere, quam ademptà spe certo perire; et potentibus extremisque præsidii pugnare, quam nihil agere."*

The application of blisters, moxas, the actual cautery to the spine, and a hundred other remedies and plans of treatment have been proposed, with an account of which we have not thought it worth while to burthen our pages. Tetanus, like cholera and other intractable disorders, has a host of alleged remedies, the very multitude of which is a proof of their inefficiency.

Of the local treatment of the traumatic species we have nothing more to say, than that very little benefit appears to have been derived from the various methods to which surgeons have resorted. Amputation of the injured limb, counter-irritation in the wound, division of the neighbouring nerve,† pressure by the tourniquet, stimulating applications, &c. &c. have been found useful by some, and altogether inefficacious, if not prejudicial, by others. For more particular information upon these points we must refer to works on surgery.

(J. A. Symonds.)

TONICS, (τονικά, from τῶς, *tension, tone.*)

—Tonics are medicinal agents that restore the sound and healthy elasticity, the strength and the vigour of the body when it is weakened and relaxed.

When an individual is in good health, and in vigour of body, the muscles or moving organs feel firm and tense; they act regularly and powerfully, and there is that voluntary reaction or state of extension between antagonist muscles, as Galen has justly remarked, by which they are removed from a modification of rest, and in which the one yields to the other, not from debility, but in the precise ratio of the power exercised over it; and this whether the muscles are involuntary, or those under the control of the will. This is a state of *healthful tone*. On the contrary, when the muscles feel soft and flabby, when the action of the involuntary is languid and the voluntary do not rapidly respond to the will; when there is a strong inclination for rest and indulgence; and when the movements of the body or its parts are performed with difficulty, this is a state of *deficient tone* or *debility*. That both these states are connected with the condition of the muscular fibre, may be demonstrated by detaching a muscle from the bodies of two animals, in these opposite conditions, and ascer-

taining its strength by appending weights to it: the muscle taken from the healthy animal, or that in a state of *tone*, will sustain a much greater weight than that which is in the opposite condition. Hence, to a certain extent, *tone* implies a difference in the mechanical condition of muscles, a greater degree of density and cohesion of their ultimate component fibrils; but this must be also joined with elasticity, that is, the power of resisting extension to a certain degree, and of restoring the previous condition, when the extending cause is removed, before the muscles can be said to be in the state of perfect tone. That this state is truly the result of vital energy is evident; for the same muscle, after a short time has elapsed, loses the power of sustaining the weight which it at first supported; and this in proportion to the distance of time from that of its separation from the living body.

Medicines, or medicinal agents which produce this state of healthful tone, and renew and maintain the tension and vigour of the muscular fibre, are thence denominated tonics. They do not act in an obvious or appreciable manner on the healthy body; but their influence is powerfully displayed in its relaxed or debilitated condition. They act on the vital principle through the medium of the nerves; and, as far as their mode of operating is understood, they may be regarded as excitants. But it is undoubted that the excitement which is the result of the action of stimulants is always followed by proportional languor or collapse: how then, it may be reasonably inquired, can those substances which produce a permanent effect on the vital energy be regarded as excitants? Are we to suppose that the difference caused by general excitants, when they produce a tonic effect, depends on a state of the parts? If not, to what are we to attribute this diversity of effect from causes which are similar? It is difficult to reply to these questions; and we can only affirm, that there appears to be something in the nature of the stimulus, which regulates both the extent and the energy of its action; and, according to the degree of its powers in these respects, the effect which it produces is more or less transitory. If the nature of the medicine or agent be such as to induce a sudden and high state of excitement, it is as quickly followed by collapse; and the changes resulting in both states are sufficiently obvious. The agent in this case is a simple excitant. But when the nature of the medicine is such that the excitement is slowly induced on the tissue to which it is applied, and very gradually extended to other parts; when the consequent exhaustion is scarcely obvious; and when the stimulus is renewed before this is complete, the impression becomes in a certain degree permanent; and consequently there is a gradual abatement of exhaustion; while at the same time the increased vigour, which is the result of the action induced, remains: then the agent which thus operates is a tonic. Still we must admit that there is merely a modification of the same action in both these cases: if the dose of the stimulant

* Jason, de Morbis Cerebri, ex Valesio, cap. 21.

† A case in which this operation was beneficial may be found in the Dublin Journ. of Med. and Chem. Science, vol. v., p. 311. extracted from the Calcutta Med. and Phys. Trans.

be so reduced that the effect is slight, and it be repeated at short intervals, then the ultimate effect will be tonic: on the contrary, if the administration of the tonic be carried to excess, it will exhaust the powers of the system; and, if administered in a state of excitement, its effects will be as injurious as those of a direct stimulant. We are therefore authorized in regarding tonics as excitants, permanent in their effects, because gradual and moderate in their operation.

Nature of tonics.—Tonic agents are both mental and material. With regard to the first, experience has demonstrated that *confidence* and *hope* are powerful tonics. Every practitioner who has had many years' experience knows well the paramount importance of confidence in the treatment of diseases, and the great advantages derived by gaining ascendancy over the mind of a patient. In the same manner, *hope* operates as a powerful tonic. Deprive a patient of this solace, even after his disease is removed and debility alone remains, and there can be no solid assurance of his recovery to perfect health; inspire him with the hope that his recovery is certain, and the prognostic will seldom fail to be realized. It is much easier to demonstrate the power of these mental agents, than to explain their mode of action: the limits of this article will not permit us to enter upon the subject.

With regard to the second set of tonic agents, or material substances, some writers* have maintained that *bitterness* is essential to all tonics, or, in other words, is the tonic principle; others† that tone is the result of the influence of three distinct matters,—namely, *extractive*, *tannin*, and *gallic acid*; and others, that it is produced by an alkaline or azotized principle. But it does not appear that *bitterness*, or any single quality of matter, can alone be regarded as productive of tone. It is, it is true, a quality of almost all vegetable tonics; but many substances which are simple bitters, such as quassia, display less tonic influence than those which possess both an aromatic and a bitter quality. Bitters alone scarcely affect the force of the circulation; aromatics operate in too transitory a manner, and stimulate too powerfully; but in combination each aids the other, and, indeed, the most powerful vegetable tonics contain these two qualities conjoined. It is by no means, however, a tenable position that bitterness is essential even to vegetable tonics; for example—pure tannin, which possess considerable corroborant powers, contains little or none of this principle; and it is even less tenable that nitrate of silver and some other metallic salts are indebted to their bitterness for the tonic powers which they possess, as asserted by the justly distinguished author of the *Pharmaologia*.

With regard to *extractive*, *tannic*, and *gallic acids*, the first substance, although existing in large quantity in all vegetable tonics, certainly cannot be regarded as alone capable of

operating as a tonic. What is usually regarded as extractive is a brittle, brown, shining substance, soluble in water and alcohol, but insoluble in ether. When oxydized, it becomes insoluble in water and inert. Extractive certainly has a tonic influence, but it is much modified by circumstances: it is generally in combination with tannin, which also is liable to variation, both in its characters and in its powers; and although it exerts an evident tonic influence on the living solid, yet its effect is more that of an astringent than of a tonic; and the same may be affirmed of gallic acid. If it must therefore be admitted that each of these substances operates as a tonic *per se*, it must also be admitted that they cannot be regarded as tonic principles, because they are not individually or collectively present in all tonics. It is scarcely necessary to make any comment on the opinion which regards tone to be the result of an alkaline or azotized substance; the other principles already mentioned operate as undoubted tonics; and the inference is evident that no single principle can be regarded as the sole cause of tone. This opinion is confirmed by the experiments of Dr. Crawford, who ascertained this curious fact, "that the property of strengthening the intestines and of weakening the skin, is common to all the substances justly celebrated for the cure of intermittent fevers." This power, he found, belongs to ipecacuanha, tartar emetic, muriate of ammonia, gentian root, chamomile flowers, and Peruvian bark. Indeed, when we reflect on the diversity of character and the number of the medicinal agents that produce tonic effects, it is evident that tone is the result of certain impressions on the vital tissues which may be communicated by many substances, and therefore that the hypothesis which refers it to any single principle cannot be maintained.

Action of tonics.—If a moderate dose of any tonic substance be taken into the stomach, its influence, even upon the organ into which it is introduced, is scarcely perceptible; but on repeating the dose at short intervals, its power in controlling the functions, not only of the stomach itself, but those of the other vital organs of the body, becomes gradually obvious; the appetite is improved, the powers of assimilation are augmented, the secretions altered, and a fresh energy and vigour infused into every part of the system. We proceed to examine in what manner these effects are produced, first on the digestive organs, and afterwards on each of those systems in which we can trace the influence of the agents employed.

1. *On the digestive organs.*—When a vegetable tonic is taken into the stomach, it is first partially digested, and the active matter is thus separated from the inert. This active part then exerts its influence upon the mucous membrane of the stomach, and the bundles of muscular fibres beneath it suffer contraction: the same circumstance occurs through the whole length of the intestinal canal; the coats of the intestines become firmer and more resisting, whilst their cavity is contracted. The primary action, therefore, is upon the stomach and ali-

* Dr. Paris, Dr. Chapman.

† Barbier, &c.

mentary canal; but a secondary follows it upon the rest of the system. It is scarcely possible to refer the extension of the tonic power to any thing but nervous energy; although some of the metallic tonics are absorbed and carried into the circulation, and the vegetable tonics never produce their effects until their active principles are separated by the digestive function, and time is given for their absorption; but admitting that they are carried into the circulation, still the impression which produces their tonic effect must be made on the nervous centres, and it is thus extended over the entire system.

If the stomach is labouring under disease, the action of tonics produces effects which require to be noticed. When the stomach is suffering from relaxation of its coats, a salutary effect follows the administration of tonics; the appetite is awakened, and chymification is favoured. When simple irritation exists, tonics increase the evil: this is manifested by a red, dry tongue, and thirst, pain and fulness of the epigastrium, anxiety, and a strong desire for acidulous and cold fluids. If ulceration of the stomach exist, and this at the cardiac portion, little effect is produced by a tonic; but if it exist at the pylorus, or in the great curvature of the organ, the impression of the tonic is made evident by a sensation of heat and pain which cannot be mistaken. Thus, in cancer of the organ, if ulceration have commenced, tonics cause great uneasiness, morbid secretions, vomitings, heat, and severe lacerating pains. A knowledge of these facts is highly important in a practical point of view.

As appetite and digestion are promoted by the operation of tonics on the stomach itself, it may appear singular that their frequent and long-continued use is generally followed by a loss of tone; but such is really the case.

2. *Upon the circulating and respiratory organs.*—Tonics act upon the heart through its sympathy with the stomach, and also by the absorption of the active principles of the substances employed, so that they can be directly applied to the moving centre and to the coats of the bloodvessels, and thus increase their muscular energy. After the administration of a full dose of a tonic medicine, the pulse is fuller and firmer, but the current of the blood is not accelerated. The tonic strengthens the organs without precipitating their action. This influence of tonics is extended to the capillary system. In a diseased condition of the heart, however, the influence of tonics is hurtful, and extends to other organs. When hypertrophy, for example, of the left ventricle of the heart is present, their employment causes cephalalgia, vertigo, ringing in the ears, and epistaxis, or congestions in the brain; when the right ventricle is the seat of this disease, the use of tonics is often followed by cough, oppressed breathing, and spitting of blood.

In a healthy state of the lungs, no appreciable effect on those organs follows the employment of tonics; but when labouring under disease, the influence of tonic substances on

them is conspicuous. In an irritable condition of the lungs they excite cough, a sensation of heat in the chest, and a feeling of anxiety. In an inflammatory state either of the substance or the membranes of the lungs, the intensity of the symptoms is increased, the cough is augmented, and the expectoration suppressed. If tubercles be present, both bitters and astringents augment the cough, increase the general restlessness, and hurry on the fatal issue of the disease. On the other hand, when the lungs have suffered from previous severe disease, but all excitement is over, tonics lessen the force and frequency of the cough and promote expectoration.

3. *Upon the secreting system.*—It is chiefly upon the renal and subcutaneous glands that tonics exert any influence; but in adding strength to those organs, they do not increase their secreting powers: the action of the glands is maintained in that state which they preserve in health. Tonics produce no marked action on the urinary organs in a state of health, but in disease they invigorate the kidneys and secure their ordinary operation. In an irritable state of these organs, tonics add to the mischief; but in a leucophlegmatic condition, tonics increase the urinary discharge; they enter the circulation and augment the vitality of the kidneys. They also increase the energy of the cutaneous capillaries, and consequently are indicated in cases of great debility accompanied with profuse sweating. In some conditions of the skin, they suppress the perspiratory function, as in some fevers, in which their administration is rapidly followed by a dry burning skin.

4. *On the muscular system.*—It is upon the muscular system that tonics chiefly display their influence; and they are supposed to act upon it through the medium of the nerves. Every muscle is amply furnished with bloodvessels and nerves, both of motion and of sensation; the latter, it is true, do not appear, “in invisibilem pulpam deliquescere,” as Blumenbach expresses himself, and then unite intimately with the muscular tissue; nevertheless any excitant, before it can produce a change in the condition of a muscle, must necessarily act at the same instant on the nerves of the part; and the discoveries of Bellingeri and Sir Charles Bell have satisfactorily demonstrated that no motion can occur in the body without the medium of at least one set of nerves. But the change effected upon muscles by tonics does not augment their contractile power; and, although it strengthens them, yet it does not render them more agile: tonics, therefore, in reference to this system, render a man stronger or more capable of active exertion, but not more active.

It is scarcely necessary to remark that the influence of tonics on the muscular system is much modified by disease.

5. *On the nervous system.*—On the nervous system tonics operate in two ways:—1. by their direct and topical influence on the nerves of the stomach, which convey the impressions they receive to the brain and spinal cord, and

through them to every part of the body: 2. by their active principles being taken into the blood, and carried to the nervous centres. The impressions made in either of these cases do not display any obvious effects on the brain in a healthy condition of the body; but in the opposite state their effects are very striking. Thus in an irritable condition of the encephalon, tonics produce symptoms approaching to those of maniacal excitement, and diffuse over the body an augmented susceptibility to external impressions. If the medullary portion of the spinal cord is morbidly excitable, tonics are apt to induce spasmodic movements: if the theca be inflamed, all the symptoms are augmented; heat, tension, and tenderness are experienced along the course of the spine; and the diseased condition of the part is confirmed.

The effects of tonics upon the general system are never rapidly displayed; but after they have been taken for some time, their influence is obvious by the increased force of the circulation, the greater energy of the digestive organs, the improvement of the secretions, the abatement of nervous susceptibility, and the augmented power in particular which is communicated to the muscular system. The effect of a tonic, when administered under proper circumstances, and when it operates favourably, is, in fact, to place the system in that state which characterises health; and from the mode by which it produces this effect, the description of diseases in which tonics are indicated is sufficiently obvious: they are evidently those of depressed power.

The chief utility of tonics as medicinal agents is in convalescence, when there is a state of great debility after attacks of acute diseases; but in this condition, the power of tonics is required to be aided by that of moderate excitants; and a combination of bitters and aromatics is found to be more useful than simple tonics.

The view which has been taken of the operation of this class of medicines enables us to arrange the agents belonging to it into two distinct sub-classes, *material* and *immaterial*; and these again into four orders, namely,—1. *material tonics*, which produce their effects by a direct or primary action on the stomach; 2. *material tonics*, which operate through the medium of the blood; 3. *material tonics*, which influence the body solely through the nerves; 4. *immaterial tonics*, which operate through the mind.

1. The *organic products* which belong to the first of the above orders are alkaloids, resins, bitter extractive, tannic and gallic acids, and volatile oil.

a. The alkaloids are the active principles of the tonic barks; the first which we shall notice is,

a. *Cinchona*, the active principle of pale cinchona bark, *cinchona lancifolia*, and that also of Angustura bark, *cusparia febrifuga*. In the first of these barks it is combined with kinic, in the second with igasauric acid. It can be readily separated from either; but on account of its insolubility in water, one part requiring two

thousand five hundred parts of that fluid at 212° Fah. for its solution, it is never prescribed except in combination with an acid, and the sulphuric has been found the best adapted for this purpose. It is unnecessary to describe, in this place, the method of procuring *cinchonia* in a pure state: it is a white transparent salt, in needleform crystals unalterable in the air, displaying an alkaline reaction, soluble in alcohol and volatile oils, but only slightly soluble in ether; inodorous, and bitter to the taste. It is a compound of carbon, hydrogen, oxygen, and nitrogen.* The kinic and the igasauric acids, with which it is combined in these barks, have no influence on the animal economy, but they render the *cinchonia* soluble, and enable this tonic principle of the barks to be taken up both by water and alcohol. There is no reason why the kinate or the igasaurate should not be employed in their separate state; but the *sulphate* is more easily procured, and answers every indication that a tonic can be expected to fulfil.

The sulphate of cinchonia is formed by the direct combination of the alkaloid and sulphuric acid. It crystallizes in short, lamellar, truncated prisms, soluble in fifty-four parts of water at 65° Fah. and six and a half parts of alcohol of sp. gr. 817. With an additional quantity of acid a bisulphate is prepared, which crystallizes in acicular octohedral prisms, soluble in half their weight of cold water, and in an equal weight of alcohol.†

The pale bark, of which cinchonia is the active principle, although designated in the Pharmacopœias as the bark of *cinchona lancifolia*, is probably obtained from several other species of cinchona.‡ That usually preferred in this country is the *bark of Lima*, which appears to consist chiefly of the bark of the *cinchona glandulifera* of Ruiz and Pavon. Although it is almost inodorous in substance, its infusion and decoction are agreeably aromatic, and moderately bitter and austere, but not disagreeable, to the taste. All infusions and decoctions of astringent vegetables render its infusion, decoction, and tincture turbid, owing to the decomposition of the kinate of cinchonia, and the combination of its alkaline base with tannin, (*tannic acid*,) which produces an insoluble, inert, tannate of cinchonia. On this account not only are such vegetable infusions and decoctions incompatible in prescriptions with the preparations of pale bark, but infusion of galls is employed as a test of the goodness of the bark; the quantity of cinchonia being in the direct ratio of the

* The proportions are 20 equiv. of carbon = 122.4 + 12 hydrogen = 12 + 1 nitrogen = 14.15 + 1 oxygen = 8, making the equivalent of the salt 156.55.

† The sulphate consists of 156.55 parts or 1 equivalent of cinchonia + 40.1 or 1 of sulphuric acid + 36 or 4 of water, making the equivalent of the salt 242.55: the composition of the bisulphate is 67.241 of cinchonia + 17.241 of acid + 15.518 of water, = 100.

‡ *Cinchona nitida*, *C. hirsuta*, *C. scrobiculata* of Humboldt, and *C. glandulifera* of Ruiz and Pavon also yield pale bark.

abundance of the precipitate thrown down in the decoction by infusion of galls. In prescribing the fluid preparations of this species of cinchona bark, it should also be remembered that precipitates are produced in them by tartar emetic, the sulphates of iron and of zinc, the acetates of lead, hydriodate of iron, the carbonates of the alkalis, and the tinctures and salts of opium; but these precipitates do not render the cinchonia inert as the infusion of galls does, and by many of them it is not precipitated. With muriate of baryta no obvious change takes place, although that salt and also the kinate of cinchonia are decomposed; but both the muriate and the kinate of cinchonia which result are soluble salts. When sulphuric acid is added to the infusion or decoction of pale cinchonia, the kinate of cinchonia is changed into the sulphate, and the alkaloid in this state being more completely separated from the other components of the bark, it is advisable to acidulate with this acid the water to be employed for making these preparations. The simple tincture of bark is an alcoholic solution of the kinate, tannin, and colouring matter, and, consequently, it is a useful preparation in cases in which alcohol is admissible: the compound tincture is more stimulant than the simple, on account of the aromatics which it contains; but the ammoniated tincture is at least of doubtful efficacy, as far as concerns the cinchonia, as much of this salt is precipitated by the volatile alkali. The best preparation of this bark is the resinous extract of the London College; it consists of the kinate in the same combination as in the simple tincture, without the alcohol, and in a more concentrated state.

The Angustura or cusparia bark, besides cinchonia in combination with igasauric acid,* as an igasaurate, contains an acrid volatile oleo-resin, gum, extractive and muriate of ammonia, and traces of brucia: thence it is more excitant than pale bark, in whatever form it is prescribed.† Owing to the acid which it contains, and the absence of tannic and gallic acids, the infusion does not precipitate tartar-emetic and gelatine; whilst with nitric acid a precipitate of a lemon yellow colour is slowly produced, but it is affected by all the other substances that precipitate the preparations of pale cinchonia

* This acid is characterised chiefly by affording a pea-green precipitate with ammoniated sulphate of copper; it exerts no obvious influence on the animal system.

† It is of importance to distinguish the true from what is denominated false cusparia bark, which is supposed to be the bark of some species of strychnos, and exerts a poisonous influence on the stomach. It is distinguished by its solidity and weight being greater than that of the true cusparia; by the epidermis being covered with distinct, rust-coloured, warty elevations; by impressing a disgusting durable bitter on the palate instead of the aromatic bitter and slight acrimony of true cusparia; and particularly by the infusion in water acidulated with muriatic acid precipitating Prussian blue when tested with ferro-cyanate of potassa, whilst none is formed in the acidulated infusion of the true bark; and, finally, by nitric acid striking a deeper crimson colour than with the true bark, owing to the presence of brucia. This bark is often mixed with the true.

bark. The dose of the cusparia bark in the form of powder is from gr. x. to 3ʒ.

Quinia, another alkaloid, the active principle of the yellow cinchona bark, the *cinchona cordifolia* of the Pharmacopœias, differs from cinchonia in not being crystallizable when uncombined with an acid, and very soluble in ether. In other respects it resembles cinchonia in its chemical properties,* and, like it, combines with two distinct proportions of sulphuric acid, forming a sulphate and a bisulphate.† The former salt is procured in pure white silky needleform crystals, which effloresce in the air, and require seventy-four parts of water at 60° Fah., and thirty parts of boiling-water for their solution. The bisulphate crystallizes in quadrangular compressed prisms, generally truncated, soluble in eleven parts of water at 60.° and in nearly the same proportion in diluted spirit, but scarcely soluble in strong alcohol. On account of its greater solubility, the bisulphate is preferable in composition to the neutral sulphate, which is generally imperfectly converted into it by acidulating the mixture containing it with diluted sulphuric acid. These sulphates are precipitated from their aqueous solutions by the infusions of all astringent vegetables and lime-water: with acetate of lead, an insoluble sulphate of lead is thrown down, and an acetate of quinia remains in solution, which is a less irritating preparation than the sulphate, and may, consequently, often supersede it with advantage. No change is produced on either of the sulphates by the salts, a practical advantage of considerable importance.

The yellow cinchona bark is more bitter, but less austere to the taste than the pale bark; besides an acidulous kinate of quinia, it contains a small proportion of kinate of cinchonia, kinate of lime, a fatty matter, tannin, a red insoluble colouring matter which precipitates in the decoction as it cools, a yellow colouring matter, and fecula. The same substances which affect the infusion and decoction of pale bark also cause precipitates in those of the yellow, and are consequently incompatible in prescriptions with its preparations.

In the red bark, the *cinchona oblongifolia* of the Pharmacopœias, both the kinates which we have described are contained in almost equal proportions. It is more acidulous than either the pale or the yellow bark, and it seems to contain more tannin, and probably some free gallic acid, as its secretion strikes a deep blue-black with persulphate of iron. Its astringency and stimulant properties exceed those of the two other official species of cinchona bark.

These alkaloids, whether in a separate state

* The components of quinia are 20 equiv. of carbon=122.4+12 hydrogen=12+1 nitrogen=14.15 +2 oxygen=16, making the equivalent of the salt 164.55.

† The composition of these sulphates is—

	Neutral sulphate.	Bisulphate.
Quinia	80.9	63.5
Sulphuric acid	10.0	19.1
Water	9.1	17.4
	100.0	100.0

or in combination in the barks which yield them, are powerful tonics and antiperiodics. When they are received into the stomach, they operate topically upon its tissue, causing often a slight sensation of weight and uneasiness in the organ, dryness in the mouth, and an evident excitement in every part of the system; effects which differ from those caused by stimulants only in degree and in their permanency. It is to this sustained influence that we must ascribe their power of changing diseased into healthy action; and this does not seem to depend so much on the absorption of the alkaloids as on the impression which they make on the digestive organs being communicated by nervous sympathy to the rest of the system, and in part on the more perfect chymification which is the necessary result of the invigorated state of the stomach. In prescribing, therefore, either the cinchona or the cusparia bark, or the salts of their alkaloids, the topical effects which they produce point out the necessity of directing our attention to the state of the stomach and intestines before prescribing them, and of not administering them internally when these important organs are in a morbidly irritable condition. They are not, however, contraindicated on this account when they are introduced into the system either, according to M. Pointe's method, by rubbing them in fine powder upon the gums, until the whole is absorbed, cautioning the patient not to swallow the saliva; or, as Signor Broglia dal Perseco has proposed, by sprinkling them in fine powder upon blistered surfaces. The writer of this article has seen the first of these methods followed by the most beneficial results.

With respect to the question at one time much agitated respecting the period of fever in which cinchona bark ought to be prescribed, there still exists much diversity of opinion; but, notwithstanding the authority of Dr. Clarke of Newcastle, and Dr. Heberden, few practitioners in the present day venture to prescribe it at every period of the disease, or until a decided intermittent character be obvious, under which circumstances these barks and their alkaloids seldom fail to prove serviceable: indeed, this may be regarded as a general rule to guide their administration,—that whenever diseases assume an intermittent type, whatever may be their denomination, whether gout, rheumatism, eruptive fevers, catarrhs, or even phthisis, bark and its preparations seldom fail to be useful, and rarely or never are productive of injury. Even in local affections this rule holds good. Sir B. Brodie was consulted by a gentleman who had a spasmodic stricture of the urethra, which recurred in paroxysms every alternate night, and continued until five or six o'clock in the morning. The disease was cured by administering large doses of sulphate of quinia, at short intervals. In neuralgic attacks, also, which assume an intermittent type, it is equally beneficial; and in rheumatic inflammation of the sclerotic coat of the eye it may be almost regarded in the light of a specific. Circumstances nevertheless interfere to modify the influence of these barks and their preparations.

When hepatic symptoms are present, they prove invariably hurtful; and, indeed, every state of the habit indicating inflammatory action should be subdued before they can be properly prescribed. Their efficacy is also modified by local and topographical circumstances. In India, says Mr. Annesley, although the bark is the grand remedy in fevers during the cold season, it fails in the rainy season, during which calomel and antimony only prove useful. With respect to the doses in intermittent affections, some physicians of deserved reputation recommend large doses;—namely, ʒiii. of the powder of bark, or gr. x. of the sulphate of cinchonia or quinia, either immediately before or after the paroxysm; but we have found that more certain benefit has followed the administration of doses of gr. ii. repeated every hour or every second hour during the interval than of large doses at long intervals.

Besides the forms of administering the alkaloids which have been described, they have been administered per anum, and have cured agues, but in this form they are apt to cause violent colic.

The *resinoids* differ from the tonic alkaloids in their chemical properties, and have not equal powers as tonic agents, although their influence is still considerable. The most energetic of this class is undoubtedly *salicin*, the active principle of the bark of the *salix alba*, and of some other barks in the same natural family of plants. It is procured in white acicular prismatic crystals, extremely bitter, and soluble in a moderate degree in water and alcohol at 60°; but not at all in ether or volatile oils. In its ultimate components it differs from cinchonia and quinia in containing no nitrogen.* It forms precipitates with infusions of astringent vegetables, acetate of lead, and tartar emetic. The bark from which it is chiefly procured, that of the white willow, was introduced to the notice of the profession as an antiperiodic by Dr. Stone; but, as it required to be administered in very large doses, it never became a popular remedy. Salicin has set aside this objection: it operates in the same doses as the cinchonic alkaloids, and being much cheaper than them, it is likely to be soon very generally employed. Baths made with a decoction of willow bark are employed, on the continent, in weakness of the lower extremities in infants. The tincture is the best preparation of the bark; but the introduction of salicin has nearly superseded the use of the bark in any form.

Piperina, another resinoid, has been still more lauded as an antiperiodic than salicina. It is obtained from black pepper, which has long been a popular remedy in intermittents, and was regarded as an alkaloid by its discoverer,† and others, until M. Pelletier demonstrated the fallacy of this opinion. It is a

* The components of salicina are 2 equiv. of carbon=12.24+2 hydrogen=2+1 oxygen=8, making the equivalent of the salt 22.24.

† M. Oerstadt, of Copenhagen. It consists of 80.95 parts of carbon+8.13 of hydrogen+10.92 of oxygen in 100 parts.

crystalline body; and when pure, its crystal is a flattish quadrilateral prism, with two parallel large and two small sides, terminated by an inclined plain, of a pale yellow colour and semitransparent; insoluble in cold water and scarcely soluble in hot; soluble in alcohol and acetic acid. Piperina is seldom altogether free from a pungent, very acrid fixed oil, with which it exists in combination in the pepper; thence its tonic powers are always combined with an excitant quality which necessarily modifies their influence, and must regulate its administration. This oil gives a pungent taste to the piperina, which in its pure state is insipid. The less pure it is, the more its acrid qualities are felt in the stomach and the intestinal canal: it causes great heat in the epigastric region, purges with colic, and leaves an uneasy sensation in the lower bowels, which continues for many days. These symptoms are due to the topical impression of the acrid oil contained in the piperina on the gastric tissue, as they are not experienced when the resinoid is quite pure; and to this oil, also, may be attributed the tingling sensation and eruption of small pustules which sometimes accompany the treatment of intermittents by piperina. It is by no means yet ascertained how much of the influence of the resinoid as an antiperiodic is due to this oil. As it exists in chamomile flowers, in which it has been discovered by the author of this article, it is also combined with a fixed acrid oil distinct from the volatile oil to which the aroma of the plant is due. Long pepper contains less of this oil, and although it also operates as an antiperiodic, its influence is less energetic.

These remarks suggest the question—Is the antiperiodic influence that of tone? In reply, it must be admitted that no simple tonic, wholly or nearly devoid of stimulant power, cures intermittents; and it is well known that perturbing powers of an immaterial kind, powerful passions of the mind, violent exercise, and such like; and also strong diffusible excitants, such as alcohol, opium, and ether, applied to the system at the moment of the accession of the rigor, have not only the power of checking a paroxysm, but even of completely breaking the catenation of morbid actions which constitute the disease, and consequently of removing it. It is true that a simple tonic operating for a long time steadily on the system may gradually subdue ague, but the effect is slow and progressive: on the other hand, the sudden beneficial influence of the excitant is seldom permanent; and thence we may conclude that although both tonics and excitants may be in strictness regarded as antiperiodic, yet that it is the combination of the two on which we must chiefly rely; and, consequently, if pure piperina be a simple tonic, it is less to be depended upon as a remedy for ague than when it contains some portion of the acrid fixed oil with which nature has combined it in the vegetable productions from which it is obtained. The dose of pure piperina is from four to six grains, but in its impure state it is seldom necessary to increase it beyond three or four grains, and

then its acrimony should be sheathed by combining it with some bland demulcent or simple bitter extract. In prescribing it, its insolubility in aqueous fluids must always be kept in view; and this is one disadvantage attending its use, as in the form of pill its primary effect being exerted on one portion of the stomach causes very uneasy sensations in the gastric region, which are not experienced from the salts of cinchonia, quinia, or salicina.

Gentian, *chironia centaurium*, lesser centaury, chirayita, and calumba, perhaps owe their tonic influence to principles closely resembling the resinoids, and consequently the above remarks are applicable to them. They can scarcely be regarded as antiperiodics, but their tonic influence is undoubted; and as simple corroborants, in convalescence from acute diseases, their freedom from irritant properties renders them more generally applicable than the antiperiodic tonics. The addition of an aromatic, when indicated, is always readily obtained by combining them with volatile oils in the form of oleo-saccharum, the doses of which can always be apportioned to the degree of stimulus required.

Bitter extractive, which is probably a compound of various vegetable products, exerts also a tonic influence on the diseased frame. We find it variously combined with other principles in Iceland liverwort, quassia, and simaruba barks, which have all been successfully employed in diseases either characterized by defective tone or debility, the sequel of acute affections which have exhausted the powers of the habit.

When a simple bitter is indicated, quassia will seldom disappoint the expectations of the practitioner, and it has the advantage of undergoing no chemical change when its infusion is combined with the salts of iron. It is particularly indicated in cases of dyspepsia connected with much irritability of stomach, in which, at the same time that it is necessary to allay this, the tone of the organ must be improved. In such cases quassia is advantageously combined, either with pure alkalies or with hydrocyanic acid. Thus combined, it fortifies the tissue, and supplies energy to the digestive organs without accelerating the pulse, or causing any increase of the animal temperature.

Bitter extractive is the tonic principle in many vegetable bodies. It is generally found in combination with gallic acid, tannin, and volatile oil, which, although when separate, or the principle components of the vegetable body, cannot be strictly regarded as tonics, yet when thus united with bitter extractive greatly aid its tonic power. It is that solid, transparent residue which remains in combination with other principles, when a vegetable infusion is slowly evaporated, and which is oxidized, and rendered insoluble in water, when the solution containing it is long boiled in contact with the air,—an effect which explains why long decoction of some medicinal barks renders them inert; why extracts, slowly prepared even in a water bath, are seldom active medicines, or are at least much inferior to those prepared in

vacuo. It is contained chiefly in roots, barks, and leaves; is inodorous, and varies in taste according to the nature of the other components with which it is combined in different plants, for it is never obtained in a state of perfect purity.

Bitter extractive is contained in combination with a resinoid, which has been termed calumbina, in the calumba root. The aqueous infusion of this root strikes a beautiful blue with tincture of iodine;* is precipitated by infusion of galls, yellow cinchona bark, acetate of lead, bichloride of mercury, and lime water; but not by muriate of baryta, sulphate of iron, nitrate of silver, nor tartrate of antimony and potassa. The new crystallized principle, *calumbina*, is procured from calumba by digesting the powdered root in ether, filtering, and evaporating. It possesses in an eminent degree the bitter taste of the root.

Dr. Duncan supposed that calumba root contains cinchonia, and certainly the action of reagents on its aqueous decoction might seem to confirm his opinion; but the examination of the root, by M. Planché and M. Guibourt, has not detected this principle in calumba. The central part should be separated before making an infusion or decoction of the root. As calumba possesses no astringency, and is little stimulant, it is perhaps the best tonic in phthical cases. It has also a considerable power in allaying the irritability of stomach accompanying pregnancy and dyspepsia, and, occasionally, dentition. Dr. Denman recommended it in the low stage of puerperal fever; and as a tonic, in combination with rhubarb and sulphate of potassa, it is extremely useful in the mesenteric affections of infancy and childhood. Calumba root is one of a few vegetable medicines which should be given in the form of tincture, the alcohol taking up the active principles only of the root. The dose of the tincture is from $\mathfrak{f}\text{ss}$ to $\mathfrak{f}\text{ssiii}$, and even more if the patient have been accustomed to the use of ardent spirits.

The root of *avens*, *gei urbani radix*, also owes its properties to bitter extractive. It has been little employed as a tonic in this country; but on the continent it is much used in intermittents, and in convalescence from acute diseases. It is also regarded as a useful corroborant in chronic diarrhoea and in scurvy.

Extractive is developed in *Iceland liverwort*, *cestraria Islandica*, by muriate of tin; gum by subacetate of lead; and fecula by the tincture of iodine. The tonic powers of Iceland lichen certainly depend on the bitter principle; and therefore, when it is employed as a tonic in

the latter stage of phthisis, the bitter should not be wholly removed. Even when it is to be employed as nutriment, there is too much anxiety to remove the bitter, a small portion of which is requisite for aiding the digestion of the fecula. But, as the bitter is very nauseous to many palates, a part of it may be removed by boiling the lichen twice, and adding to the first boiling a small quantity of any alkaline carbonate. The addition of five or six minims of diluted sulphuric acid, and $\mathfrak{f}\text{ss}$ of syrup of white poppies, to $\mathfrak{f}\text{ss}$ of the decoction, affords an excellent tonic in phthisis, and in cases of great emaciation from acute disease. In cases of chlorosis and imperfect menstruation, the decoction may be advantageously combined with sulphate or muriate of iron, as in neither case is any precipitate produced.

Marsh trefoil, *menyanthis trifoliata folia*, after losing 75 parts in 100 of its weight in drying, consists chiefly of bitter extractive, and a peculiar substance approaching to the character of animal matter. The infusion strikes a deep black with persulphate of iron, shewing the presence of gallic acid; throws down a copious precipitate with alum and muriate of tin; and also precipitates infusion of yellow cinchona bark. The extractive is rendered insoluble by solution of chlorine.

Menyanthes acts powerfully on the stomach, and in an irritable state of that organ produces a deleterious impression; it is taken into the circulation and stimulates the capillaries: nevertheless it is an admirable tonic, and would be much prized if it were less common. In large doses the infusion excites vomiting, and, under certain conditions of the body, purges or acts as a diuretic, as the surface is more or less exposed. It checks intermittents, and is peculiarly useful in rheumatism when it takes on an intermittent character. It was formerly much prized as an emmenagogue. On account of its nauseating properties, it is useful to combine it with aromatics.

Uva ursi was recommended by Dr. Bourne in phthisis pulmonalis; but the remedy has not succeeded in the hands of other practitioners. He combined ten grains of the powder of the leaves of the plant with fifteen grains of cinchona bark and half a grain of opium, and gave this mixture three times a day. The effect of this mixture was to lower the pulse without adding to its force: it palliated the symptoms, and, in some cases, appears to have effected a cure.

No adjunct to bitter extractive aids its tonic influence so effectually as volatile oil, and this combination is found in cascarilla bark, calamus aromaticus, and myrrh. The first, besides the oil and bitter extractive, contains resin and gallic acid, possesses antiperiodic powers, and has been substituted for cinchona bark in the treatment of remittent and intermittent fevers; but its influence in these diseases has been greatly overrated. As an aromatic it aids the powers of the pale cinchona bark, and those of the salts of cinchonia and quinia; but its infusion forms precipitates with infusion of the yellow cinchona bark, and is consequently in-

* This distinguishes it from a false calumba lately introduced, which is further known by its white colour, lighter texture, and its taste, which is at first sweetish, and not half so bitter as that of the true calumba. Its infusion also reddens the tincture of litmus; caustic potassa disengages ammonia from it; salts of iron precipitate its infusion black; and ether, digested on it, acquires a bright yellow colour; none of which effects are presented by true calumba.

compatible with it. Neither can it be prescribed with sulphate of iron, the salts of lead, or lime-water. It is useful in all cases in which a combination of a tonic and aromatic is indicated, as in flatulent colic, the latter stages of dysentery, and old asthmatic affections; and is peculiarly suited to cases of gangrenous thrush in infants, and in that state of languor and emaciation, accompanied with tumid tense abdomen, which depends on obstruction of the mesenteric glands. It is contra-indicated, however, when there is the least tendency to inflammatory action, and it has been accused of producing a tendency to hæmorrhoids. The virtues of the acorus *calamus*, or *calamus aromaticus* as it is usually termed, closely resemble those of cascarilla, and even exceed them in antiperiodic powers. The writer of this article has frequently seen both cinchona bark and sulphate of quinia, after failing to cure ague, succeed in rapidly removing the disease when conjoined with *calamus aromaticus*. The volatile oil, which is now procured in a separate state, may be used with advantage instead of the powder or infusion of the rhizome, in the form of an oleo-saccharum; and we cannot avoid remarking here the propriety of employing the volatile oils, in this form, in combination with the alkaloids and tonic metallic salts instead of the substances which yield them, as the latter often contain matters which decompose the salts and render them inert. If sulphate of quinia is prescribed in combination with the *pulvis aromaticus* of the Pharmacopœia, the salt is decomposed and an inert tannate of quinia formed; but no such effect follows the combination of this salt with the volatile oils of the various aromatics composing the powder. *Myrrh*, which is now known to be the product of the balsamodendron *myrrha*, is a compound of volatile oil, resin, and gum. It is a stimulant tonic, well adapted to cases in which the powers of the constitution have been worn down by chronic disease; as, for example, humid asthma and old obstinate catarrhs, as it stops the progress of that exhaustion which accompanies profuse expectoration: on this account, also, its watery solution, in combination with nitrate of potassa, camphor, foxglove, and opium, is often prescribed in phthisis; but it is only in the entire state that it can, in any way, prove beneficial in that intractable disease. It proves useful in chlorosis, and in defective action of the uterine system in pale leucophlegmatic girls, when combined with preparations of iron, particularly the ioduret of that metal; and added to oxide of zinc, its utility in a peculiar cough which occasionally accompanies pregnancy, of which the tendency is to induce abortion, is well ascertained.

The inorganic substances which operate as tonics are *metallic oxides*, *arsenious acid*, and some *metallic salts*.

With regard to the first of these preparations, it may be remarked that, when oxygen is combined in one definite proportion with a metal, the oxide is soluble in the animal fluids, and either enters the circulation, and is there de-

composed, or exerts a primary tonic influence on the stomach. It is those only of the latter description which we have now to notice.

Lime in its solution in water as lime-water, has generally been regarded as a moderate tonic of this kind; but its influence on the nerves of the stomach is rather that of a sedative than a tonic, allaying the irritability of the organ, and thereby favouring the secretion of a more healthy gastric juice, and consequently a more perfect chymification. It is only on this account that it can prove beneficial in dyspepsia, as its antacid properties are too trifling to be beneficial as a chemical remedy. Under any circumstances it is of little value. *Oxide of zinc*, although it has not fully realized all that was anticipated by the distinguished physician who introduced it into practice, is a tonic of much value. In the decline of diseases of a spasmodic character, it has been found extremely beneficial; as, for example, in whooping cough, when the cough is kept up by custom acting on a weakened, irritable frame of body. The most useful form of prescribing it is in combination with the pure alkalies, in an excess of which it is soluble. In this form it is especially indicated in that weakened condition of the digestive organs which induces psoriasis and some other cutaneous eruptions; the alkali allays the irritability of the stomach, whilst the oxide of zinc restores its tone. It is only the protoxide of iron that possesses active properties as a tonic; and this forms one portion of the scales from the anvil. Its action is slow, and, therefore, it is only adapted for those cases of general debility in which a permanent rather than a rapid effect is required; its efficacy is much increased by its meeting with acid in the stomach, so as to aid its solution and consequent absorption into the blood. The dose is from gr. v. to 3ss; and it is known to be in active operation by the black colour of the alvine discharges.

Arsenious acid exerts a most powerful antiperiodic influence in all affections of an intermittent character; but there are objections to its employment in this form, which would have altogether thrown it into disuse, had Dr. Fowler not suggested the combination of it with potassa, so as to form an arsenite, in the liquor arsenicalis, the arsenical solution of the pharmacopœias. In this preparation there is scarcely a sufficient quantity of potassa to saturate the whole of the arsenious acid. Each fluid drachm of the solution contains a grain of the arsenite, or half a grain of arsenious acid; consequently, the dose of eight minims, that generally commenced with, contains nearly 1-16th of a grain. In this dose, gradually increased, if necessary, to forty or fifty minims, the arsenical solution has been advantageously administered, as a tonic, for the cure of intermittents. With respect to its mode of acting, it seems to exert a primary stimulant influence on the stomach, assisting the digestive powers of that viscus; and, both by that effect and also by the extension of its tonic influence to the whole system, to remove the debility which favours the repetition of the intermittent paro-

xysm. The diaphoretic power may also add its curative influence in intermittents; as it is well known that many substances which have no other power than that of increasing perspiration, and consequently diffusing the blood equally over the system, cure agues.

The arsenical solution has been given, with benefit, in those cases of chronic rheumatism which assume an intermittent type: it has also proved occasionally useful in symptomatic epilepsy, chorea, and other spasmodic affections, as well as the tic douloureux and cephalgia. Its efficacy in lepra and some other cutaneous diseases, when given in conjunction with large doses of the pure alkalis with conium, is well established.

In the treatment of cancer, arsenious acid has been both internally administered and externally applied; but whilst the benefit to be expected from its administration is doubtful, its deleterious agency has been manifested in many cases, even where its use has been confined to the surface. When applied to an external wound, it sometimes causes almost immediate inflammation of the stomach, accompanied with violent vomiting and purging; and death is as likely to ensue in such cases as if it were internally administered.

Sulphate of zinc as a tonic exerts a primary influence on the stomach, but a secondary, also, on the general system. It is supposed to operate with less excitement than the other metallic salts, and to be well adapted for cases of phthisis and the humid asthma of old men; in both of which disorders, besides supporting the general tone of the system, it is supposed to diminish both the quantity and the acrimony of the expectorated matter. The acetate of zinc operates nearly in the same manner, but is less frequently employed as an internal remedy.

Sulphate of copper is a powerful but hazardous tonic. It has been given in doses of a quarter to half a grain in spasmodic affections, twice or three times a day. In chronic diarrhoea, in similar doses, it has been found to check the purging, and increase tone. It was resorted to in the attack of Asiatic cholera which visited our island; but, although it seemed to aid in lessening the discharge, the benefit was not such as would recommend its general employment. It seems to influence chiefly the nerves of the intestines, and thus, by increasing the tone of the bowel, to diminish the excretion of the exhalents. The dose of this sulphate, as a tonic, may be gradually increased to two grains, which ought not to be exceeded. The subacetate possesses the same properties in every respect, but it is even more apt to cause poisonous symptoms than the sulphate. The *subnitrate of bismuth* is free from this objection. It has been found to be particularly useful, in doses of from two to six grains in combination with one grain of opium, in pyrosis, affording almost immediate relief to the pain and sense of constriction which constitute the paroxysm.

Muriate of baryta also operates by a direct action on the stomach; it was introduced as a tonic in scrofulous affections, by Dr. Crawford, but it has not been generally employed. In

prescribing it, it should be recollected that it is decomposed by phosphates, sulphates, and all astringent vegetable infusions, insoluble inert compounds being the result of such combinations.

The tonics that operate through the medium of the blood are chiefly oxides, iodides, metallic salts, and the mineral acids. They all enter the circulation, and can be detected in the secretions.

One of the best preparations of iron, as a tonic, is undoubtedly the ioduret or iodide, already mentioned in the article *STIMULANTS*.* It possesses the advantage of the iodine as an excitant and deobstruent modified by the tonic power of the protoxide of iron; so that, whilst the former is affording activity to the capillary system, the iron is sustaining its tone, and improving its general vigour and energy. It has been found highly efficacious in all cases requiring the aid of a stimulating tonic, more especially in those connected with deficient uterine action, chlorosis, and glandular obstructions, and in every instance of debility that demands a stimulant impulse to be given to the capillary system.

The ioduret, it is useful to know, is incompatible with the mineral acids; the alkalies and their carbonates; the sulphates, both alkaline and metallic; the acetates of zinc and of lead; arsenious acid and arsenite of potassa; nitrate of silver, and all the soluble salts of mercury; solution of chlorine; gallic acid; tannin and aqueous infusions of astringent

* As the properties of this ioduret are still little understood, and as the specimens of it in the shops of the druggists are in many instances not what they ought to be, we shall enter a little more into detail respecting its preparation than was done in our previous notice of it. It is prepared by heating together, in a flask, equal proportions of clean, soft iron wire and iodine, with twelve or fourteen times their combined weight of distilled water; boiling the mixture until it wholly lose the colour of the iodine, and then filtering. The filtered fluid, which ought to be of a very pale greenish straw colour, should then be evaporated to dryness in a flask, terminating the process the instant the smallest appearance of the purple vapour of the iodine is perceptible. The flask should then be broken, and the ioduret, whilst it is still warm, put into a well stoppered bottle, and secured from the action of the air. Well prepared ioduret of iron is of a dark iron-grey colour, breaking with a crystalline fracture, and dissolving completely in twice its weight of distilled water. When exposed to the air, it rapidly attracts moisture and is decomposed, the iron parting with the iodine, and attracting oxygen so as to be converted into the peroxide, which, on dissolving the ioduret, falls down as an insoluble red or ochrous precipitate. This decomposition also occurs, when the filtered solution, whatever may be its degree of strength, is exposed to the air; but when a piece of clean soft iron wire is put into the solution, and permitted to remain in it for three or four days, and the fluid then filtered, it will keep limpid and undecomposed for any length of time. This solution is most convenient for medicinal use when it contains, in every fluid drachm, three grains of the ioduret; but it must be remarked that in solution it is changed to a hydriodate of the protoxide of iron, returning, however, to the state of the ioduret on evaporating the solution to dryness. In the dry state it is a compound of 28 parts of iron, and 126 of iodine, or one equivalent of each.

vegetables; the tinctures of kino, hyosciamus, and galls; sulphates of morphia, quinia, and muriate of morphia. On account of its deliquescent property it cannot be prescribed in the form of pill; and in solution it becomes a hydriodate. It is contraindicated in every condition approaching to that of positive excitement.

Nitrate of silver, the first of the metallic salts belonging to this division of tonics, communicates general vigour to the body, by acting primarily on the stomach; but it is also absorbed and taken into the circulation—a fact demonstrated by the leaden hue which it sometimes communicates to the skin of those who take it. Although it operates as a powerful escharotic when applied to the surface of the body, yet the vitality of the stomach is sufficient to resist its chemical influence: its dose may be carried to the extent of even five grains three times a day. The best mode of administering it is in the form of pills, made up with crumb of bread. It is always advisable to preface its use by emptying the stomach and bowels; for when much acid, either muriatic or acetic, exists in the alimentary canal, it is decomposed and rendered inert. No salt food, nor much salt, should be used by persons taking this nitrate, as these form an inert chloride of silver in the stomach.

Nitrate of silver was early employed as a tonic in the treatment of disease; but, from want of due precaution in its administration and the harshness of its operation, it fell into disuse. It was reintroduced by Dr. Sims of London, who employed it in the treatment of epilepsy, and from his success it became much used. In looking at its value in this disease, truth obliges us to say that, except in protracting the return of the paroxysms in symptomatic epilepsy, little is to be expected from its employment. In chorea, however, its merits have not been too highly extolled. It has also been given with great advantage in angina pectoris.

The administration of nitrate of silver is productive of one great inconvenience, which stands in the way of its general employment as an internal medicine—it is apt, (as already hinted,) in some habits, to give an indelible leaden or saturnine hue to the whole skin. With respect to the cause of this change of colour of the skin, if we admit that the nitrate is taken into the circulation undecomposed, and arrives in that state at the capillaries of the skin, we must also admit that it may be decomposed there, converted into chloride of silver, and deposited in the rete mucosum. The chloride acquires a grey leaden colour whenever it remains in contact with animal matter; and, as it is insoluble, it is incapable of being reabsorbed, and a permanent stain is given to the skin. This effect, therefore, happens whenever a more than usual quantity of muriates is separated by the cuticular capillaries. No remedy for this inconvenient effect of nitrate of silver has yet been suggested. We imagine that, by ordering diluted nitric acid, at the time of administering this salt, its de-

composition may be prevented; for, although we keep in view the difference between the living system and the laboratory of the chemist, yet it is not improbable that the employment of nitric acid may frustrate the evil by preventing the decomposition of the nitrate.

As a local tonic, the nitrate of silver has been lately successfully employed in chronic inflammation of the eyes; and to this local influence may be in great part ascribed its utility in diseases of the mucous tissues affecting the secreting surfaces, and in ulcerations, as recommended by Mr. Higginbottom. It is true that it acts in ulcerations by forming as it were an artificial cuticle of the part, which chemically unites with the nitrate; but we are inclined to believe that something is also due to its tonic power. On the same principle, it cures the inflammation of the cervix uteri dependent on increased irritability of the part.

All the salts of iron belong to the class of tonics now under consideration: the *subcarbonate* has, however, attracted the greatest attention; but owing to the nature of the preparation, it is a most uncertain medicine. The carbonate of the pharmacopœias is prepared by decomposing the protosulphate of iron in solution by subcarbonate of soda; but oxygen is so rapidly attracted from the atmosphere by the precipitate in drying, that it passes into the state of peroxide, and consequently loses its carbonic acid; and no means hitherto devised have been able to prevent this change from taking place.

To render this preparation perfect, the sulphate of iron should be recently prepared, or in the state of a protosulphate, as the oxide afforded by the persulphate does not combine with carbonic acid. When it is carefully prepared, this subcarbonate, according to Mr. Phillips, should consist of—carbonate of iron 40, + peroxide of iron 60, in 100 parts. But it is generally so carelessly prepared, that it does not contain more than ten per cent. of carbonate of iron. When properly prepared, it is soluble in the juices of the stomach, and is readily taken into the circulation; and, as the carbonate is undoubtedly the active principle, it becomes a matter of great importance that the carbonate should really be the salt administered; and this can always be ensured by making it at the moment it is to be taken. An aqueous solution of eight grains of protosulphate of iron, mixed with a solution of ten grains of subcarbonate of soda, and immediately swallowed, will afford a dose of ten grains of protocarbonate of iron in its most active state; whereas, a dose of the ordinary subcarbonate contains little more than a grain only of the salt. The dose of the subcarbonate is from ten grains to four drachms.

All the preparations of iron, whether those formed by the hand of nature in chalybeate waters, or those contrived by the artifice of man, exert a powerfully tonic effect. They increase the digestive powers of the stomach, stimulate the intestines, and, being dissolved in the gastric and intestinal juices, are taken up by the absorbents, enter the blood, and stimulate the

whole system. This is demonstrated by the pulse being rendered stronger and quicker, the heat of the body and thirst being augmented, the countenance rendered more florid, and the whole powers of the system being called into action. It has been denied that iron is absorbed into the blood; but a series of experiments, detailed in the second volume of the Bologna Commentaries, places the fact of its absorption beyond a doubt.

With regard to the medicinal powers of the salts of iron, the natural chalybeates are of eminent service in all cases requiring tonics: their primary effect is displayed on the digestive organs, whence their influence is propagated, rousing the nutritive faculty in every part of the body: they augment the power of the secretory system; and, by the moderate but permanent nature of the impression which they impart to the nerves, increase the tone and general vigour of all the functions. Something is undoubtedly due, at the same time, to the circumstances connected with drinking mineral waters at their source. But tone follows the use of iron in all its forms, and therefore its preparations are employed in every disease connected with relaxation or debility, particularly of a chronic kind: dyspepsia, hysteria, amenorrhœa, leucorrhœa, scrophula, and chronic catarrh, are a few of the catalogue of those which chalybeates are calculated to benefit. When salts of iron are indicated, the doses should be large; but the propriety of giving the large doses of the carbonate which have been lately recommended is questionable. Even in *tic douloureux*, we have never found it necessary, if the preparation be good, to exceed a drachm for a dose; and, in chorea, we have seen every benefit derived from the regular repetition of smaller doses at short intervals. In a weakened state of the uterine organs, causing a defective secretion of the menstrual fluid, the salts of iron are productive of the best consequences; but when amenorrhœa is accompanied with heat in the region of the uterus, pain of the loins, and plethora, they prove hurtful. In both cases, the effects are attributable solely to the tonic influence of these preparations. Reflecting on the chemical characters and medicinal powers of the carbonate, the sulphate, and the muriated tincture, it is evident that they are sufficient for every indication desired from the salts of iron; and therefore all the other preparations of this metal might be dispensed with and rejected from the pharmacopœias.

The long-continued use of preparations of iron seems to predispose to disease by causing an excess of tone; thence those who have thus employed them are liable to inflammation, active hemorrhage, and similar affections.

All the *mineral acids* are powerful tonics, especially in those cases of great debility in which petechiæ display themselves. The sulphuric, diluted and combined with wine, is the only remedy on which we can rely in the confluent small-pox, when the pustules are filled with a bloody sanies and the urine is coloured

by broken-down particles of blood. In cases of immoderate perspiration, also, as, for instance, in the hectic of phthisis pulmonalis, it is the appropriate remedy; and, in combination with aromatics, it removes many of the urgent symptoms of dyspepsia, and is altogether a tonic of the highest value when judiciously employed. In administering it, however, even in the diluted state, some anomalous effects occur which should be retained in remembrance. Thus, when given to women who are suckling, it acts powerfully on the system of the infant, causing gripings, and frequently convulsions, although it has never been detected in the milk of the mother. A case, extracted from a German journal, appeared in the Medical Gazette of May the 10th, 1828, in which a woman poisoned herself with concentrated sulphuric acid. The last efforts of nature were exerted to give birth to a child, in whom, upon examination, sulphuric acid was detected in the cavity of the pleura and the peritoneum, and also in the heart and bladder. Its presence was also ascertained in the liquor amnii. Sulphuric acid cannot be combined in prescriptions with muriate of lime, lime-water, barytic-water, or the solution of acetate of lead, or muriate of baryta; insoluble compounds being produced by these combinations.

The tonic effects of *cold bathing* have been already noticed (see BATHING); it therefore only remains to notice the *immaterial* tonics.

When we contemplate the number and power of the moving organs of the body under the control of the will; the strength of the extensor and flexor muscles, and the facility with which, by their aid, locomotion is produced; few arguments are required to convince us that a state of constant rest is unnatural, and that motion or exercise is essential for the maintenance of health. *Exercise*, therefore, may be regarded rather as a prophylactic tonic than one actually adapted for the removal of disease. But, besides the immediate influence which some tonics exert over morbid actions, the greater number of this class of medicines is employed to restore vigour to the habit debilitated by previous disease; and, in this point of view, exercise has a claim to the appellation of a direct tonic. It aids in circulating the blood more equably over the system, promoting especially the action of the capillaries and the function of the skin.

Amongst the various kinds of exercise in general use, *walking* is the best which can be taken when the strength of the body admits of a moderate degree of fatigue with impunity. It throws into action not only the muscles of the lower limbs, but those of the arms and several of the largest and most important of the trunk; particularly those which, fixed in the loins, serve as flexors to the thighs. It is probable that the motions of these contribute, in some respects, to aid the peristaltic movements of the intestines, and thus to favour that regularity of the excretory function of the abdominal viscera without which health cannot be preserved. When walking, in a conva-

lescent, causes difficulty of breathing, palpitation, or pain in the region of the heart, it should be discontinued; but when it is performed with ease, it should be continued nearly to the point of fatigue.

Horse exercise requires greater powers of muscles than can be expected in early convalescence; but as it engages the upper part of the body, and occupies the arms and large muscles of the chest, which influence the motion of the lungs, it is most important as soon as it can be borne. In taking horse exercise also, something is due to the extent through which the person passes in the open air, and the absorption of the attention by the scenery; for experience has demonstrated that the mere exercise taken in a riding school, or within a limited space of ground, is not so salutary as riding in the open country. As a prophylactic of phthisis, in those predisposed to that disease, riding has been justly extolled; and even when the disease has displayed itself, if, as Sydenham remarks, it be "without fever or ulcer," riding may be regarded almost as a specific. We have often witnessed the beneficial effects of horse exercise in frames of body greatly weakened by asthma, and have seen individuals who were scarcely able to mount on horseback return from a ride vigorous and alert, and by the daily renewal of this exercise rapidly regain a degree of vigour and tone which could scarcely have been anticipated. When horse exercise or walking cannot be resorted to, the next best is carriage exercise or sailing; but it must be recollected that scarcely any of the influence of these can be referred to the muscular system.

Friction may be regarded as a species of exercise, and its effects can be explained on the same principles. To produce a tonic effect it ought to be brisk, and performed in such a manner as to produce a degree of redness and warmth on the surface. The ancients judiciously employed friction after tepid bathing, and aided its influence by the administration of wine and water during the intervals of the rubbing. On this principle only can be explained the beneficial effects of the oriental custom of shampooing. In phthisis the pains of the thorax are often relieved by friction; and the influence of percussion, which may be considered a variety of friction, in chronic rheumatism, is well known.

It may be rationally enquired whether any advantage is derived from aiding the friction by stimulating embrocations or oils? If the friction be well performed, and for a sufficient time, nothing of this kind is necessary, except to prevent the skin from being fretted; in which case, dipping the hand in dry flour or hair-powder is as useful as the most celebrated embrocation. It is only when a narcotic impression is to be added to the influence of the friction that embrocations are really useful. How far friction may owe its salutary influence to electrical agency, is a subject well worthy of examination.

Mental tonics belong to this class. The tonic effects of hope and confidence have already been spoken of, and it is unnecessary to give such illustrations as no practitioner can fail to meet with in his daily duties.

Travelling is another mental tonic; but it has a closer affinity with material tonics than either hope or confidence, and in no disease is the advantage of it more conspicuous than in hypochondriasis. In this disease there are languor and torpor of the whole body, timidity and depression of the mind, and a general disordered state of the functions of the stomach and intestines. Medicines have little influence in relieving these symptoms; but by a change of climate and of scene the disease is mitigated, and often cured. Something undoubtedly is due to the state of the atmosphere, the temperature, and other physical properties which distinguish one climate from another; but as much more advantage is procured by moving from place to place than by remaining stationary even in the most favourable climate, the salutary effect can only be ascribed to the mental excitement produced by the constant change of scene. In prescribing travelling as a tonic, it is surely unnecessary to say that countries ought to be recommended most fertile in those objects which are likely to rouse the curiosity and arrest the attention. "*Cælum patrio pulchrius, mores festiviores, et scænæ novæ et amenæ, mentem grate occupant, et imaginationem suavissime detinent.*"*

To sum up these remarks on this class of medicines, we should say that in deciding upon their employment three things require to be attended to:—1. The choice of the tonic; for although all tonics necessarily possess the same kind of powers, yet these differ in degree: some are more acid and astringent than others; some owe their efficacy to the presence of certain alkaline or acid principles; some to bitter extractive or to volatile oil modified by combination with other vegetable constituents; and some to the conjunctions of chemical agents, forming new and active compounds. We must, therefore, determine how far these principles are likely to fulfil the indication for which the tonic is to be prescribed, before selecting it. 2. The dose. It is important to regulate the dose of the tonic employed, in order to meet the demand which is required, or not to exceed the impression which can be sustained: if it be inadequate to the effect anticipated, the therapeutical indication will remain unfulfilled, and disappointment naturally ensue; if it be too great, instead of tone, excitement and collapse may be the result. 3. The mode of administering the medicine must be duly considered. If a powerful impression is intended to be made on the stomach, the medicine selected ought to be administered uncombined with other substances, and in such a dose as will produce an impression both powerful and durable: if,

* Gregory, *De Morbis Cœli Mutatione Medendis* Diss. Inaug.‡

on the contrary, the object is to introduce the medicine into the system, it ought to be associated with such substances as will favour its absorption, and to be administered in small and frequently repeated doses.

With regard to the diseases particularly requiring the employment of tonics, we may remark that in none do they produce more salutary effects than in affections of the digestive organs. The efficacy of tonics in these diseases is well established: their action upon the gastric nerves is communicated to the encephalon and spinal marrow, and the reaction of these upon the stomach awakens its powers and augments the activity of the digestive function. In selecting the tonics to be employed, those which contain bitter extractive—for example quassia, gentian, or calumba—are to be preferred: the pure bitter which these substances contain, devoid of astringency, acts in a milder manner than those which contain either gallic acid, tannin, or the alkaloids. The tonic influence which they exert on the digestive organ alters also that condition of the mucous membrane which favours the generation of intestinal worms; whilst, at the same time, some bitter substances operate as direct vermifuges or poisons to these parasites.

Although it is scarcely necessary to state that tonics are injurious in all inflammatory states of the chest, yet, when the mucous secretion is exuberant, as in chronic catarrh, tonics are decidedly indicated: in these cases the *Centaria Islandica*, the lesser centaury, and the cinchona are to be preferred to the other bitters. In hydrothorax, and in all serous accumulations within the thorax, however, they are useless, even when these states are the sequel of asthma and similar affections, in which tonics exert an unbounded beneficial influence. In conditions of the cerebro-spinal centres producing epilepsy or hysteria, symptomatic of morbid states of the circulating system—for example, hypertrophy of the heart, or of the digestive organs, in connection with hypochondriasis or melancholia—tonics are likely to produce a salutary change; but when these diseases depend on morbid conditions of the brain and spinal marrow themselves, then no advantage can be anticipated from the use of tonics. In some convulsive affections—as, for example, chorea—tonics may be regarded as the only remedies to be relied upon. In diabetes, as they improve the condition of the digestive organs and re-establish the assimilating power of the system, they are likely to alter that state of the urinary secretion which constitutes the disease; but at the same time it must be recollected that if the symptoms can be traced to any organic affection of the lumbar portion of the spinal cord, it will be vain to anticipate advantage from the employment of this class of medicines.

In cutaneous affections not symptomatic of peculiar febrile states, tonics prove useful; and this is especially the case when these eruptions are connected with depression of the general powers, manifested by a pallid or discoloured skin, a disordered state of the sto-

mach, emaciation of the body, and a sluggish condition of the bowels. In such a condition of the system the more active tonics, in particular arsenic and the metallic salts, are especially indicated.

But it is in fevers that the efficacy of tonics is most conspicuous. In simple fever they are rarely required, and in complicated cases the proper time to administer them is a matter which requires great judgment. As a general rule, their employment should be deferred whilst any obvious local disease exists in the bowels; although, even under such circumstances, when there is a necessity for supporting the system, they have been productive of the best results.

In typhous fever the indiscriminate use of tonics has been productive of much mischief. The appearance of languor and debility is no reason why they should be prescribed; as in these instances they have been found to increase all the symptoms without improving the strength. Ample experience has demonstrated that, in general, it is only after the febrile symptoms have been wholly subdued, when the patient does not rally, and the convalescence is slow, that tonics are beneficial. Under certain circumstances they may be required even during the continuance of the disease. Thus, when petechiæ appear, whilst the pulse is soft and compressible, and if there be a tendency to gangrene, not only tonics but stimulants are indicated: in such cases much advantage is obtained from a combination of volatile oil, as an oleo-saccharum, with sulphate of quinia and sulphuric acid; or, if the vegetable infusions be preferred, we should select those of *serpentaria*, *cascarilla*, or *cusparia*.

After what has been stated respecting the value of cinchona bark as an antiperiodic in intermittents, it might be supposed that little remains to be said regarding the employment of tonics in those fevers; but it is necessary to guard the student and the inexperienced practitioner from being misled by too general a view of this subject. If the intermissions be imperfect, and any local inflammation exist, much caution is requisite in prescribing tonics; and in every instance a complete state of apyrexia in the intervals should be secured before venturing upon their employment. It is essential, however, to discriminate between local inflammation of the viscera and those engorgements of the spleen and of other parts which exist in persons who have suffered from long-protracted agues, and which are generally aggravated by any fresh attack of the disease: the presence of these need not interfere with the use of the bark or arsenic. It has been asserted that the latter of these tonics may be administered even during the existence of inflammatory symptoms; but upon this point we must confess that we are sceptical. In some peculiar modifications of inflammatory action—such, for example, as occur in chronic rheumatism—arsenic may be administered; but the salts of quinia, the menyanthes, and other tonics, are equally safe and useful.

In remittent fevers much caution should be

observed in prescribing tonics. The remission should be transformed into an intermission before they can with propriety be employed: indeed nothing is so likely to change a remittent into continued fever as their injudicious administration. In infantile remittents, notwithstanding the high authority of Dr. Clarke of Newcastle, who, in his work on fever, recommends bark to be immediately resorted to after the operation of an emetic, we accord with those who delay the use of tonics until the advanced stage of the disease, when it proves obstinate: then the cascarilla, which in such

cases is generally preferred to the other barks, maintains the tone of the stomach and bowels, and enables us to proceed with the alterative and purgative plan of treatment. In the modification of fever which constitutes hectic, it must be confessed that little reliance is to be placed upon any class of medicines.

Upon the whole, it is necessary that tonics should not be confounded with stimulants, and that we should always recollect that tone is not excitement, nor strength increased vascular action.

MEDICAL BIBLIOGRAPHY,

ARRANGED CHRONOLOGICALLY

ACCORDING TO THE SUBJECTS ;

WITH THE

DERIVATIONS OF THE TERMS,

AND THE

NOSOLOGICAL AND VERNACULAR SYNONYMS.

ADVERTISEMENT.

THE following Bibliographical Collections are intended to supply an obvious deficiency in the articles of the Cyclopædia, and in some degree to fill a very important blank in the medical literature of this country which has long been felt to exist. The plan followed in the Compilation is somewhat different from any with which the writer is acquainted; and he is in hopes that he has not altogether failed in the object he had in view throughout—of rendering it of easy reference and in every way practically useful, in accordance with the general principles of the present work. To the attainment of this object he has sacrificed all minor considerations, whether having reference to his own ease and convenience, or to the credit that might attach to the display of such erudition as he is master of, or which the extensive researches which his task imposed upon him might have easily supplied.

Had the writer been ambitious of such a display, he might have readily gratified it by the accumulation of references to the miscellaneous writings of physicians in every body's hands,—to the innumerable monographs which have been printed under the form of Inaugural Dissertations in the various European Universities,—and, lastly, to the individual cases of disease, which form so large a portion of medical periodical literature; and this he might have done with little or no personal research, by merely transferring to his little work—then little no longer—the pages of Haller and Ploucquet, the Bibliographical Notices in the Dict. des Sciences Méd., and a moiety of the Indexes of the periodical medical collections, now of almost unmanageable size, in this and other countries. But want of space as well as want of inclination, and the governing principle of the Cyclopædia, practical utility, have alike prevented such a consummation; although the author is free to confess that so desirable a result has not been attained without the sacrifice of hundreds of pages of manuscript, which had been compiled before what he regards as the proper plan had been thoroughly matured.

Generally speaking, the reader will find the following pages to consist exclusively of BIBLIOGRAPHY, in the stricter sense of the word, that is, an account of *books* only. The sole exceptions to this, of a general kind, will be found to be the references to the great Medical Dictionaries (of which the individual articles have been regarded as distinct works), and to certain Collections of Inaugural Dissertations and Minor Works, which have attained high consideration and a general circulation. Few persons are aware of the very large space in Medical Bibliographies, commonly occupied by the titles of Inaugural Dissertations, which have never, properly speaking, been published, and which are not, therefore, accessible to any reader, unless he visits the library of the particular university in which the authors obtained the doctorate. To reproduce, *ad infinitum*, these titular treatises in our bibliographies is not simply to dazzle the ignorant with the semblance of learning, and at no expense, but is to delude the unwary with the bare imagination of a feast which, in all probability, they can never possibly enjoy.

References to the slighter monographs, and observations and cases in the collected works of authors, or in treatises ostensibly dedicated to other objects, or in the Transactions of Societies and Periodical Journals, are not open to the same objections, and the only reason for excluding them from the following pages is the impossibility of admitting them without superseding others of greater moment, or extending the compilation beyond the prescribed bounds. It will, indeed, be found that the rule of excluding such references has by no means been rigidly adhered to, more particularly where the matter seemed of extraordinary importance, or where the number of works on the particular subject was very limited.

It may possibly appear to some that the author has, on various occasions, given undue prominence to Foreign works; but he has, assuredly, in this particular, been influenced by no prepossession in their favour. He noted the titles of such works as came before him, without regard to the language in which they were written; and if, in several instances, the German and French publications in the list are found to exceed the English in number, the true reason must

be sought for in the fact of such publications being really more numerous in the preponderating language. While he has, in no one instance, sacrificed an English work for a Foreign one, he has, on numerous occasions, acted on the reverse principle; deeming it but proper, where the choice was limited, that the books in our vernacular tongue should have the preference in a work intended for the English reader. It is hardly necessary to observe that, in the present condition of medical literature in this country, a bibliographical collection that did not include a fair share of the publications of France, Germany, and Italy, would be deservedly regarded as most imperfect.

It has been after much consideration that the Chronological Order has been adopted in the arrangement of the titles of the different works; this plan appearing to possess important advantages over the alphabetical arrangement, more especially in such a collection as the present, where the list of works is, under no one head, very extensive. The placing the date of the publication in a conspicuous form *before* the title, will, it is hoped, render the advantages of the arrangement still more conspicuous. The adherence to the chronological order has led to one result which some may think not always satisfactory, that, namely, of recording preferably the earliest edition of the respective works. Many exceptions to this will, indeed, be met with; and, now the work is finished, we regret that while we prefixed this earliest date to the title, we did not also subjoin the dates of the subsequent editions. The omission, however, will scarcely be found a practical inconvenience, since it is always easier to procure a later than an early edition.

In the great majority of instances the exact words of the titles have been given, although it has been found necessary, for the sake of economising space, very generally to curtail them: in no case, we trust, will there be found any difficulty of recognising the work under the title given to it.

Independently of the imperfections of plan and arrangement which may be found in the Bibliography, the writer is prepared for the more serious charge of having committed important mistakes in its construction. No one who has had so much occasion to consult catalogues of books and bibliographical references of all kinds, and, consequently, to become acquainted with the manifold mistakes to be found in even the most accurate, can be so conceited as to believe that he has escaped the snares into which greater men have fallen; more especially as none else can be so well aware of the numerous and facile paths that lead to error. In truth, there is hardly any department of literature—if we may thus dignify our humble task—so beset with pitfalls which it is impossible oftentimes to escape. As a matter of course, the titles of a large portion of the books are transcribed from catalogues or the collections of preceding writers; and if the books are themselves inaccessible to the transcriber, any errors that may exist will, unless of an obvious kind, be copied also. And when it is further considered how difficult it is accurately to transcribe numerous dates,—particularly when different yet not very different,—and that the copy has to pass through the hands of fallible compositors, readers, and correctors,—it is no wonder, in a matter where the substitution of one single figure for another is of serious consequence, that blunders may and do occur. The writer can only say that he has taken all possible pains to be accurate, and he is not without hopes, all the difficulties of the case being considered, that his labours may even be found not undeserving the praise of accuracy.

The Etymology and Synonymy prefixed to the different articles is, we believe, a new feature in works of this kind. We think, however, it will be generally admitted to have a natural relation to the main subject, and, at all events, it cannot fail to be useful to students and the younger members of the profession. That several of the etymologies are mere amplifications of matters already given in the body of the Cyclopædia, is not regarded as any imperfection: if introduced at all, it was proper that they should be uniform in character. The greater number of the modern languages of which synonyms are given, are become, in these days, almost necessary acquisitions for the accomplished physician. If of this number the Dutch, Danish, and Swedish may be deemed less essential, we shall be less solicitous about the accuracy of our synonyms in these, and less concerned for our own ignorance of them: for the names of diseases in the two last-named languages we are entirely indebted to Nennich's *Lexicon Nosologicum Polyglotton*, a work of some merit, but far from accurate.

Of the time and labour bestowed on the following pages, it may be prudent not to speak, lest the actual scantiness of the harvest should appear still more conspicuous in relation to the extent of the workman's toil. We may, however, venture to say this much—that no one who has not actually made the trial is likely to form an accurate estimate of either the one or the other.

SELECT MEDICAL BIBLIOGRAPHY,

ETC. ETC.

ABDOMEN, EXPLORATION OF—DISEASES OF.

DERIVATION. The derivation of the word *abdomen* is uncertain. It is commonly said to be formed from the Latin verb *abdo*, to conceal, either simply from this word (*abdo*, *abdomen*, as *lego*, *legumen*), or from *abdo* and *omentum* conjointly. It does not, however, appear why this particular cavity should be so distinguished, seeing that its contents are not more *hidden* than those of the chest or head.

VERNACULAR SYNONYMS. *Greek*, γαστήρ, υπο-γαστήριον, υποκοιλίον, σπληνριον. *Latin*, Abdomen, venter. *English*, Belly, stomach, paunch. *German*, Unterleib. *Dutch*, Onderbuik. *French*, Ventre, bas ventre. *Italian*, Ventre, pancia, addomine. *Spanish*, Vientre, barriga, panza.

1696 *Baglivi, G. M.* De observatione hypochondriacorum in acutis (Prax. Med. lib. i. c. 6.) Rom. 8vo.

1698 *Stahl, G. E.* De vena portæ porta malorum hypochondriaco-splenetico-suffocativo-hæmorrhoidariorum. Hall. 4to.

1742 *Furstenau, J. H. A.* Abscessuum musculorum abdominis exempla. Rintel.

1749 *Quelmalz, S. T.* Programma de frictionibus abdominis (Haller Disp. ad Morb. vii. 317.) Lips. 8vo.

1751 *Kaempf, J.* De infarctu vasorum ventriculi (Baldinger Syll. iii.) Basil.

ABORTION.

DERIV. From the Latin *abortio*, from the verb *aborior*, *abortus sum*, to arise or happen prematurely, to die.

NOSOLOGICAL SYNONYMS. *Abortus*: Sauv. Linn. Sag. Cull. *Abortio*: Vog. Cull. *Dystocia abortiva*: Young. *Paracyesis abortus*: Good. *Ectrosis*: Swed.

VERN. SYN. Gr. *ἡλτομανος, ἐκτρώμα, τρώσιμος, ἐκτρώσιμος*. Lat. Abortus, abortio, abortium. Eng. Miscarriage. Ger. Fehlgeburt, unzeitige geburt, frühgeburt, missfall. Dut. Missbaaring, misval, misdragt. Fr. Avortement, fausse couche. Ital. Aborto, sconciatura. Span. Aborto, malparto.

(For the Literature, see WOMEN, DISEASES OF.)

ABSCESS.

DERIV. From the Lat. *abscessus*, a recession or receding, from *abscedo*, to recede, or go away, as the flesh in a part that suppurates.

NOS. SYN. *Apostema*: Sauv. Sag. Good, Young, Swed. *Abscessus*: Linn. Vog. Cull.

VERN. SYN. Gr. *ἀποστήμα, ἀποστασις*. Lat. *Apostema*, abscessus, suppuration. Eng. Impos-thume, gathering, boil. Scot. Bealing. Ger. Eitergeschwulst, eiterbeule, eiterhöhle. Dut. Verzwearinge, ettergezweel. Dan. Bylde. Swed. Bulning. Ital. Ascesso. Span. Absceso.

1628 Leon, Lopez, Practica y theorica de los apostemas. Mad.

1643 Severinus, M. A. De recondita abscessuum natura. Francof. 4to.

1750 Quesnay, Fr. Traité de la suppuration. Par. 12mo.

1751 Meibomius, J. H. De abscessuum internorum natura. Lips. 4to.

1765 Anon. Manière d'ouvrir et de traiter les abcès. Par. 8vo.

1776 Quesnay, Fr. Précis sur la suppuration putride. Par. 8vo.

1779 Clare, Peter, An essay on the cure of abscesses by caustic. Lond. 8vo.

1780 Darwin, C. Experiments on mucilaginous and purulent matter. Lichf. 8vo.

1788 Home, Ev. A dissertation on the properties of pus. Lond. 4to.

1789 Justamond, J. O. Surgical tracts (essay on abscess, translat.) Lond. 8vo.

1793 Abernethy, J. Surgical and physiological essays (part i. on lumbar abscess, &c.) Lond. 8vo.

1794 Hunter, John, On the blood, &c. Lond. 4to.

1796 Este, C. Tracts on medical subjects (inflammation, abscess, &c.) Lond. 8vo.

AIR, CHANGE OF—INFLUENCE OF.

DERIV. This word is almost identical in the Greek and Latin, and in the four modern languages, more or less derived from the Latin, viz. the Italian, Spanish, French, and English; it is therefore fair to trace it to the most ancient. The German and other northern tongues have another word from another source.

SYN. *Gr. Anp.* *Lat.* Aer. *Eng.* Air. *Fr.* Air. *Ital.* Aria. *Span.* Aire. *Ger.* Luft. *Dut.* Lucht.

- 1561 *Gratarolus, Gul.* De regimine omnium iter agentium, vel equitum vel peditum, vel navi vel curru vel rheda. *Par.* 8vo.
- 1599 *Palomino, Did.* De mutatione aeris. *Madrit.* fol.

AORTA, DISEASES OF.

DERIV. Gr. *Ἀορτή*. This is the word used by Aristotle for the great artery now so called, and in the same sense as *vessel* or *receptacle* (for the blood), *Ἀορτή* having this meaning originally.

Hippocrates, however, uses the same word for the larger bronchi, and probably derived his term from *αἶρ*, *air*.

SYN. Gr. *Ἀορτή*. Lat. Aorta, arteria magna cordis. Eng. Aorta; the great artery. Ger. Grosse pulsader, grosse schlagader. Dut. Grootte slagader. Fr. Aorte, grande artère. Ital. Span. Aorta.

1693 *Knipsmacoppe, Alex.* Epistola de aortæ polypo. *Lugd. 4to.*

BARBIERS.

DERIV. Unknown: vernacular Indian word.

Nos. SYN. *Berberia*: Sauv. Sag. Cull. *Synclonus berberia*: Good. *Berberia Indica*: Bon-tius. *Berberi*: Manget. Linn. *Asthenia berberia*: Young. *Paralysis berberi*: Tulp.

(For Literature, see PARALYSIS, also CLIMATE.)

BATHS AND BATHING.

DERIV. The English word *bath* is of Saxon origin, *bad*, which still retains the original form in the modern German.

SYN. (1 *Bath*; 2 *cold bath*; 3 *warm bath*.)

Gr. 1 Βαλανειον; 2 ψυχρολουσια; * 3 θερμολουσια. †
Lat. 1 Balneum, balneæ, balineum, baliniæ; 2 balneum frigidum; 3 balneum calidum.
Eng. 1 bath; 2 cold bath; 3 hot or warm bath. Ger. 1 bad; 2 kaltes bad; 3 warmes bad. Dut. 1 bad; 2 koud bad, koel bad; 3 warm bad, heet bad. Fr. 1 bain; 2 bain froid; 3 bain chaud. Ital. 1 bagno; 2 bagno freddo; 3 bagno caldo. Span. 1 baño; 2 baño frio; 3 baño caliente.

1533 Anon. De balneis omnia quæ extant apud Græcos, &c. *Venet.* fol.

1543 *Fumanellus*, Ant. Consilium, &c. et de balneis ferratis et aquæ simplicis. *Basil.* 8vo.

BERIBERI.

DERIV. Bontius and Ridley say that this term is derived from the Indian word signifying a sheep, on account of the supposed resemblance of the gait of persons affected with it, to that of the sheep. Good derives it from *βερβερι*, the pearl oyster, or other shell, and hence figuratively for *incurvation*. Marshall derives it from the reduplication of the word *beri*, signifying, in the language of Ceylon, *weakness* or *inability*, as if to express intensity of weakness.

NOS. SYN. This disease and Barbers have been almost universally confounded by nosologists. *Hydrops asthmaticus*: Rogers. *Berri berri*: Ridley. *Ballismus beriberii*: Swed.

(For Literature, see DROPSY, also CLIMATE.)

BILE AND BILIOUS DISORDERS.

DERIV. The English word *bile* is probably borrowed immediately from the French, but is unquestionably derived from the Lat. *bilis*.

VERN. SYN. Gr. *χολη, χολος*. Lat. *Bilis*, fel. Eng. *Bile*, gall, choler. Scot. *Gaw*. Ger. *Galle*. Dut. *Gal*. Fr. *Bile*, fiel. Ital. *Bile*. Span. *Bilis*, colera.

1682 *Greulich, J. G.* *Χοληλογία*, seu themata de bile sana et ægra. *Frank.* 8vo.

BRAIN, INFLAMMATION OF—DISEASES OF.

DERIV. *Phrenitis*, φρενιτις, from φρεν, the mind, properly signifying the delirium of a fever. *Cephalitis*, κεφαλιτις, from κεφαλη, the head. *Encephalitis*, from εγκεφαλος, the brain, from εν, κεφαλη. *Meningitis*, from μννιγξ, -γος, a membrane, especially the membrane of the brain: inflammation of the membranes of the brain. *Arachnitis*, from αραχνοειδης, spider-web-like, applied to the inner membrane of the brain, from αραχνης, a spider, or αραχνιον, a spider's web: properly, inflammation of the arachnoid membrane. *Arachnoiditis*, from the same origin, and having the same meaning. *Cerebritis*, from cerebrum, the brain: inflammation of the substance of the brain. *Sphacelismus*, σφακελισμος, gangrene, from σφακελος, gangrene, but also signifying 'agitation from excessive pain;' hence, probably, used for *phrenitis*. *Phrenismus*, from φρεν. *Phrenesis*, *phrenitiasis*, id. *Siriasis*, from σιριασις or σιριασις, a sun-stroke, from σερις, the Dog-star.

NOS. SYN. *Σιριασις*: Hipp. Aet. φρενιτις: Alex. *Siriasis*: Vog. *Phrenitis*: Cels. Sauv. Linn. Sag. Cull. Hoffm. Boerh. Macb. Junck. Pin. *Phrenismus*: Vog. *Sphacelismus*: Etmull. Linn. *Sideratio*: Auct. Lat. *Cephalitis*: Sauv. Sag. *Encephalitis*: Frank, Ploucq. Swed. *Inflammatio phrenitis*: Parr. *Cauma phrenitis*: Young. *Empresma cephalitis*: Good. *Cerebritis*: Foville, Crawford. *Arachnitis*: Parent-du-Chatelét. *Meningitis*: Auct. Gall. -

VERN. SYN. Gr. φρενιτις, φρενισις. Lat. Inflammatio cerebri, phrenesis, phrenitis. Eng. Phrensy, brain-fever, inflammation of the brain. Ger. Entzündung des gehirns, tobsucht, kopfwuth, hirn-fieber, hirn-wuth. Dut. Krankzinnigheid, harsenwoede. Dan. Raserie. Swed. Raseri, ryhet. Fr. Phrenesie, inflammation du cerveau, transport au cerveau. Ital. Frenesia, infiammazione di cervello, encefalite. Span. Frenesi, frenitis.

CARDIALGIA, GASTRODYNIA, GASTRALGIA.

DERIV. *Cardialgia*. Gr. καρδιαλγία, literally heart-ache, from καρδιά, the heart, and αλγειν, to suffer pain; used medically to signify pain in the stomach.

Gastrodynia, from the Gr. γαστήρ, stomach, and δυνα, pain : pain of the stomach.

Gastralgia, from the Gr. γαστήρ, stomach, and αλγειν, to suffer pain : pain of the stomach.

Nos. SYN. καρδιαλγία : Hipp. Gal. *Cardialgia* : Sauv. Linn. Vog. Sag. Darw. Pin. *Gastrodynia* : Sauv. Sag. Pin. Soda : Linn. Vog. *Dyspepsia* : Cull. Cricht. *Pyrosis* : Cull. Sauv. Sag. *Litmosis cardialgia* : Good. *Gasteralgia* : Swed. *Cardiacus morbus*, *Spasmus ventriculi*, *Cardiaca passio*, *Ardor stomachi*, *Dyspepsodynia* : Auct.

VERN. SYN. Gr. καρδιαλγία. Lat. *Cardiacus morbus*, *ventriculi dolor*, *morsus ventriculi*, *stomachi rosio*, *stomachi acrimonia*. Eng. Pain in the stomach, *cramp in the stomach*, *spasm in the stomach*, *heart-burn*. Ger. Magen-drücken, *herzweh*, *soddbrennen*, *magenschmerz*, *magenkrampf*, *wasserkolik*. Dut. Maagpyn, *hertepyn*, *herte-wee*. Dan. Mavepine, *mavesmerte*. Swed. Magverk, *magref*. Fr. Douleur de l'estomac, *colique d'estomac*, *aigreur d'estomac*, *cremason*, *fer chaud*. Ital. Mal di stomaco. Span. Dolor de estomago.

CATARRH.

DERIV. Gr. Καταρροῦς or καταρροῦς, from καταρρεῖν, to flow down, from κατα, down, and ρεῖν, to flow.

Nos. SYN. Καταρροῦς: Hippocr. Catarrhus: Sauv. Vog. Sag. Cull. Good. Coryza: Linn. Vog. Sag. Rheuma: Sauv. Sag. Anacatharsis: Gal. Sauv. Gravedo: Cels. Linn. Cauma catarrhale: Young. Febris catarrhalis: Auct. Var. Tussis catarrhalis et rheumatica: Hoffm. Ampharina catarrhalis: Sauv. Catarrheuma: Swed. Rheuma catarrhale: Sauv. Phlegmhymenitis: Ploucq. Branchus (βραγχίς): Auct. Var. Influxio: Coel.-Aurel. Tussis: Sauv. Linn. Vog. Sag. Junck. Raucedo: Linn. Raucitas: Vog. Plin.

VERN. SYN. Gr. Καταρροῦς, κατασταυρμός, ἀναπτύσις. Lat. Destillatio, gravêdo, catarrhus. Eng. Cold, defluxion. Germ. Fluss, husten,

schnupfen, schnuppen, katarrh, erkältung. Dut. Zinking. Dan. Flod. Swed. Fluss. Fr. Catarrhe, rhume, fluxion. Ital. Infreddatura, catarro. Span. Catarro, resfriado, romadizo, constipacion.

(For Literature, see BRONCHITIS.)

CHEST OR THORAX, DISEASES OF.

DERIV. *Chest* is an old English word, the more literal meaning of which is known to all. It and its congenerous northern synonyms (Celt. *kest*, Goth. *kista*, Sax. Welsh, *cyst*, Scot. *kist*) are commonly traced to the Lat. *cista* and Gr. *κίστη*, of precisely the same import, but it is quite as probable that the southern vocables are derived from the northern. When it is considered that the same word was anciently used for a *basket*, the appropriation of it to the human thorax will appear quite natural to any one who has ever seen a skeleton.

Thorax. Lat. *thorax*, Gr. *θώραξ*. The Greek word originally signified the cuirass or coat of mail, and subsequently came to be used for the part of the body which this covered.

SYN. Gr. *Θώραξ*. Lat. *Thorax*, pectus. Eng. Chest, breast. Ger. Brust. Dut. Borst. Fr. Poitrine. Ital. Petto. Span. Pecho.

1497 *Montagnana, B.* Consilia, &c. (De ægri-tudinibus pectoris) *Ven.* fol.

CHOLERA.

DERIV. *Gr.* *χολαρα* or *χολερη*. This word is commonly derived from *χολη*, bile, and *ρεω*, to flow, quasi *bile-flux*.*

NOS. SYN. *Χολερη*: *Hipp.* *Cholera*: *Cels.* *Sauv.* *Linn.* *Vog.* *Sag.* *Cull.* *Cholera morbus*: *Sydenh.* et *Auct.* *Var.* *Diarrhæa cholera*: *Young.* *Cholerrhagia*: *Swed.* *Passio cholericæ*, *Passio felliflua*: *Aret.* *Auct.* *Diarrhæa cholericæ*: *Junck.* *Dysenteria incruenta*: *Willis.*

VERN. SYN. *Gr.* *Χολερα*. *Lat.* *Cholera*, *fluxus bilis*. *Eng.* *Cholera*, *cholera morbus*. *Ger.* *Brech-*

* “Bilis supra infraque erumpit, primum aquæ similis, &c. Ergo eo nomine morbum hunc *χολεραν* Græci nominarunt.” *Celsus*, lib. iv. c. xi. —I think the conjecture stated by Donnegan (*Lex. in voce*) more probable: he derives it, by metonymy, from *χολερα*, a gutter for carrying off the rain from the roof of a house, precisely as we have seen the word *Diabetes* transferred, by a similar figure, from an instrument to the disease. Others derive the word (and Trallian among the rest, according to Good) from *χολας*, an intestine, and *ρεω*, to flow, quasi *bowel-flux* in place of *bile-flux*.

† “Qui metuunt ne cholera cum iracundia Gallicè dicta confundatur, vocant cholera-morbum.” *Sauv.* *Nosol.* *Method.*

durchfall, brechruhr, gallenfluss, gallenruhr. *Dut.* Galbraken, boord, buikwee. *Dan.* Galdesot. *Swed.* Gallsjuka. *Fr.* Choléra, trousse-galant, mort de chien. *Ital.* Colera, colera-morbus, espansione di bile. *Span.* Colera, colera-morbo.

CONSTIPATION—OBSTIPATION.

DERIV. *Lat.* constipatio, a pressing, or crowding, or cramming together, from *constipo*, to crowd or cram, from *con* and *stipo*, to cram; adopted in its present sense, probably, from the idea of the contents of the bowels being so crammed together as to obstruct the passage.

Obstipation. *Lat.* obstipatio (not in use by classical authors), from *obstipo*, having the same meaning as *constipo*, *ob* and *stipo*.

NOS. SYN. Σκληρα κοιλια: *Hipp.* Astrictio alvi: *Cels.* Constipatio alvi: *Darw.* Obstipatio: *Linn.* Vog. Sag. Cull. Stypsis (Gr. στενσις): *Ploucq.* Obstipatio alvina: *Young.* Coprostasis (from κοπρος, fæces, and στασις, stagnation): *Good.* Ischocoilia (κοιλια, the belly, ισχω, to restrict): *Swed.* Dyscoilia: *Swed.*

VERN. SYN. Γτ. Σκληρα κοιλια. *Lat.* Astrictio alvi, alvus astricta, corpus astrictum. *Eng.* Costiveness, confinement of the bowels, constipation. *Ger.* Hartleibigkeit, stopfung, stuhlverhaltung, leibverstopfung, verstopfung des leibes. *Dut.* Hartlyvigheid. *Dan.* Haardt liv, forstoppelse, bindelse. *Swed.* Hårdt lif, förstoppning, häfte. *Fr.* Constipation, ventre paresseux, reserrement de ventre. *Ital.* Durezza di ventre; costipazione di ventre; stitichezza di ventre. *Span.* Dureza de vientre; estreñimiento de vientre.

(See DYSPEPSIA.)

CONTAGION—INFECTION.

DERIV. *Contagion.* Lat. *contagio, contagium, contagēs*; literally, *contact*, from *con* and *tango*, to touch, but more commonly used in the bad sense, of defilement or pollution from contact.

Infection. Lat. *infectio*, a stain or dye (though hardly ever used in this sense), from *infectio* (*in* and *facio*), to stain or dye, and also in the bad sense of to taint, to corrupt.

VERN. SYN. Lat. *Contagio, contagium, contagēs*. Eng. *Contagion, infection*. Ger. *Ansteckung*. Dut. *Besmetting, onsteeking*. Fr. *Contagion, infection*. Ital. *Contagione, infezione*. Span. *Contagio, infeccion*.

CRISIS.

DERIV. *Gr.* κρίσις, a separation, decision, or judgment, from κρίνω, to separate, to decide.

VERN. SYN. *Gr.* κρίσις. *Lat.* Crisis. *Eng.* Crisis. *Ger.* Crisis, Entscheidung der krankheit, oordel, afscheiding der ziekte. *Ital.* Crisi. *Span.* Crisis.

(For Literature, see PROGNOSIS.)

CROUP.

DERIV. *Croup*, the vernacular name given to the disease by the common people in Scotland. Its derivation is unknown, but it is supposed by some to be named from the disease in the domestic fowl termed *pip*, (in some parts of Scotland called *roup*,) which is accompanied by a modification of voice supposed to be analogous to that of the subjects of croup.

NOS. SYN. *Affectio orthopnoica, Difficultas spirandi:* Ballon. *Angina strepitosa:* Ghisi. *Morbus strangulatorius:* Starr. *Angina latens:* Dodon. *Angina canina:* Zac.-Lus. *Angina interna:* Tulp. *Angina suffocativa:* Bard. *Angina perniciosa:* Horst. *Suffocatio stridula:* Home, Monro. *Morbus truculentus infantum:* Van Bergen. *Catarhus suffocativus Barbadiensis:* Hillary. *Angina membranacea, Angina polyposa:* Michaelis. *Angina trachealis:* Mease. *Angina trachealis infantum:* Pinel. *Angina infantum:* Wilcke. *Asthma infantum spasmodicum:* Rush. *Cynanche trachealis:* Sauv. Cull. *Cynanche stridula:* Crawford, Parr. *Empresma bronchlenmitis:* Good. *Cauma bronchitis:* Young. *Asthma acuta infantum:* Millar. *Angina membranosa:* Sachse. *Tracheitis infantum:* Albers, Frank. *Cynanche laryngea:* Eller. *Angina laryngea exudatoria:* Hufeland. *Peripneumonia trachealis, Expectoratio solida:* Darw. *Bronchitis:* Swed. *Orthopnea membranacea:* Auct. *Tracheitis sicca:* Friedlander. *Laryngo-tracheite:* Blaud. *Diphthérie:* Bretonneau. *Phlegmasie tracheale aigue:* Ravenau.

VERN. SYN. *Gr.* Συναγχή, ποναγχή. *Lat.* Angina, synanche. *Eng.* Croup, hives (Amer.). *Ger.* Bräune, polypose bräune, häutige bräune, pfeifende bräune, huhnnerwehe. *Swed.* Strypsincka. *Hung.* Levegotsopip, pip. *Fr.* Croup. *Ital.* Crup, cinance tracheale. *Span.* Groppa, croup.

CYANOSIS.

DERIV. From *κυανωσις*, the colour of blue, from *κυανος*, a blue stone (lapis lazuli), or blue flower (blue-bottle).*

NOS. SYN. *Icteritia cyanea*: Paracels. *Cyanosis*: Baumes. *Morbus cœruleus*: Schuler et Var. *Cyanopathia*: Marc. *Exangia cyania*: Good. *Cyania*: Cricht.

VERN. SYN. Gr. *Κυανωσις*. Lat. *Morbus cœruleus*. Eng. Blue disease, blue skin. Ger. Blausucht. Fr. Cyanose, ictère bleu, ictère violet, cachexie bleue. Ital. Male ceruleo. Span. Azul enfermedad.

* This word is commonly derived from *κυανος* and *νοσος*, *morbus cœruleus*, and I believe M. Baumes originally formed the term in this manner; but this derivation would lead to pronouncing it short instead of long. The word *κυανωσις* is classical.

1832 Copland, Dict. of Pract. Med. (art. *Blue Disease*) *Lond*.

CYNANCHE (MITIS ET MALIGNA).

DERIV. Gr. *κυνάγχη*, from *κυν*, a dog, and *αγχω*, to throttle, to strangle: literally dog-choke. The disease is supposed by some to be so called from its occasioning a noise in breathing like that made by dogs when being strangled. By others it is said to be from the patient being obliged to breathe like a dog, with open mouth and protruded tongue.

NOS. SYN. Παρακυνάγχη, Συναγχή, Παρασυναγχή, Παισθμία: Auct. Græc. *Angina*: Cels. Hoffm. Boerh. Vog. Junck. *Synanchica passio*: Coel. Aurel. *Angina canina*: Zacut. Lusit. *Cynanche*:

Sauv. Linn. Sag. Cull. Par. *Tonsillitis*: Cricht. *Cauma paristhmilis*: Young. *Empresma paristhmilis*: Good. *Angina gutturalis*: Pinel. *An-tiuditis*: Swed. *Isthmitis*: Swed. Ploucq. *Pharyngitis*: Cricht. *Angor faucium*, *Pruna*, *Prunella*: Auct.

VERN. SYN. Gr. *Κινάγχη*, *παισθμία*, *φλεγμοναί των κατὰ τον ισθμόν χωρίων*. Lat. Angina, synanche, inflammatio gutturis, inflammatio faucium. Eng. Squinancy, squinsy, quinsy, sore throat, throat disorder. Ger. Kehlsucht, halsweb, bräune, halsentzündung, halsbräune, halsgeschwulst, halsgeschwür. Dut. Kwade keel, worg-gezwel, keel-onsteeking. Dan. Halspine, halsvee, halsbrynde, halssyge. Swed. Halsjuka, halstäppa. Fr. Esquinancie, mal de gorge, squinancie, prunelle. Ital. Angina, mal di gola, schienanzia. Span. Garotillo, angina, esquinencia.

1820 *Kunze, G.* De dysphagia. *Lipz.* 8vo.

DYSPNŒA.

DERIV. *Lat.* *dyspnœa*, from Gr. *δυσπνοια*, from *δυσπνοω*, to breathe with difficulty; from *δυσ*, badly, and *πνέω*, to breathe.

NOS. SYN. *Δυσπνοια*: Hipp. Gal. Coel.-Aurel. Cels. *Spirandi difficultas*: Cels. *Dyspnœa*: Sauv. Linn. Vog. Sag. Macb. Cull. Junck. Swed. *Orthopnœa*: Cels. Boerh. Sauv. Linn. Vog. Sag. Macb. *Suffocatio*: Etmull. *Pnigma*: Vog. *Pneusis dyspnœa*: Young. *Asthma continuum*, *Asthma spurium*: Auct.

VERN. SYN. Gr. *Δυσπνοια*, το *δυσπνουν*. *Lat.* *Dyspnœa*, *spirandi difficultas*. *Eng.* *Dyspnœa*, short breath, short-windedness, pursiness, phthisic. *Ger.* Schwerer athem, engrüstigkeit, kurzer athem, beschwerliches athemholen, schwerathmigkeit. *Dut.* Moeyelyke adem. *Fr.* Respiration embarrassée, difficulté de respirer, pousse, dyspnée. *Ital.* Dispnœa, difficoltà di respirare. *Span.* Disnea, ahoguido.

(For the Literature, see *ASTHMA*.)

DYSURIA.

DERIV. *Lat.* *dysuria*: Gr. *δυσουρία*, from *δυσουρω*,

to have a difficulty of making water; from *δυσ*, badly, and *ουρον*, urine.

NOS. SYN. *Δυσουρία*: Auct. Græc. Cicero. *Στραγγουρία*: Paul.-Ægin. Cels. *Urinæ difficultas*: Cels. *Dysuria*: Sauv. Linn. Vog. Sag. Cull. Swed. Crich. *Stranguria*: Vog. Linn. *Glus*: Linn. *Pyruria*: Sauv. *Paruria stillatitia*: Good. *Ischuria dysuria*: Young.

VERN. SYN. Gr. *Δυσουρία, στραγγουρία*. Lat. *Dysuria, difficultas urinæ, stranguria*. Eng. Dys-
ury, strangury, difficulty of making water, pain-
ful micturition. Ger. Harnstrenge, harnwinde,
harnbrennen, schwer-harnen. Dut. Moeyelyk-
heid in watermaaken, brandende pis, heete pis.
Dan. Trængpis. Swed. Urintvång, pinksveda.
Fr. Dysurie, difficulté d'uriner, ardeur d'urine.
Ital. Disuria, ardore d'urina, difficoltà d'urinare.
Span. Disuria, ardor de orina, dificultad de
orinar.

(For the Literature, see CYSTITIS, and URINARY
ORGANS, DISEASES OF.)

EAR, DISEASES OF.

VERN. SYN. (I. ear.) Gr. *Ους*. Lat. *Auris*.
Eng. Ear. Ger. Ohr. Dut. Oor. Dan. Ore.
Swed. Or. Fr. Oreille. Ital. Orecchio. Span.
Oído. Port. Orelha.

(II. Diseases of the ear.) Gr. *Ωτος νοσος*. Lat.
Auris morbi. Eng. Diseases of the ear. Ger.
Ohrkrankheiten. Dut. Oorziekten. Dan. Ore-
sygen. Swed. Orsjuka. Fr. Maladies de l'o-
reille. Ital. Malattie del orecchio. Span. En-
fermedades de oído.

1590 *Mercurialis, H.* De compositione medi-
camentorum: de morbis oculorum et aurium.
Ven. 4to.

1601 *Grammaeus, Th.* De morbis oculorum et
aurium. Venet. 4to.

ritisme de la trompe d'Eustache. Par. 8vo.

1830 *Cooper, S.* Surgical Dictionary (art. *Ear*)
6th ed. Lond.

1834 *Burne, Cyc.* of Pract. Med. (art. *Otalgia*
and *Otitis*) vol. iii. Lond.

ECTHYMA.

DERIV. Gr. *εκθυμα*, an eruption on the skin, a
blister or pustule, from *εκθωω*, to break out: th.
εκ and *θωω*, to rush.

NOS. SYN. *Τερμινθος, Θερμινθος, Επιφυκτις*: Hipp.
Gal. *Terminthus*: Wisemann, Lorry, Turner,
Plenck, Vog. *Epinyctis*: Sauv. Vog. Sag. *Ec-
thymata*: Vog. Swed. *Ecthyma*: Willan, Bate-
man, Rayer. *Ecpyesis ecthyma*: Good. *Phlysis*
ecthyma: Young. *Psoris crustacea*: Alibert. *Me-
lasma*: Plenck, Linn. Vog.

VERN. SYN. Arab. Albotin, albotes, schera,
botsor. Eng. Scall, tetter, papulous scall, ulce-
rated tetter. Ger. Erbsenblattern, eiternde flechte,
schälblasen, blattern. Dut. Puisten. Fr. Am-
poules, boutons, pustule.

(For the Literature, see SKIN, DISEASES OF.)

ECZEMA.

DERIV. Gr. *εξζυμα*, that which is thrown up
by boiling—a pustule; from *εξζωω*, to boil up, to
break out.

NOS. SYN. *Eczema*: Auct.-Græc. Willan, Bate-
man, Rayer. *Ecphlysis eczema*: Good. *Cytisma*
eczema: Young. *Hidroa*: Sauv. Vog. *Ecze-
sis, Eczesma, Eczesmus*: Auct.

VERN. SYN. Eng. Heat eruption, heats. Ger.
Schweitblattern, hitzblätterchen. Dut. Vuurige
puisten. Fr. Echauboulure, ampoule ardente,
poussée, dartre vive.

(For Literature, see SKIN, DISEASES OF.)

1826 *Howison, W.* On epistaxis. *Edin.* 8vo.

1831 *Blandin, Dict.* de Méd. Prat. (art. *Epistaxis*) t. vii. *Par.*

1833 *Kerr, Cyc. of Pract. Med.* (art. *Epistaxis*) vol. ii. *Lond.* 8vo.

(See HÆMORRHAGE.)

ERETHISMUS.

DERIV. Gr. *ερεθισμος, ερεθισμα*, irritation, excitement; from *ερεθίζω*, to excite or irritate. *Erethismus mercurialis*, a peculiar state of irritation produced by mercury.

ERYSIPELAS.

DERIV. Gr. *ερυσιπελας*. The derivation of this word is unknown, although many attempts have been made by lexicographers and nosologists to explain it. The most ordinary derivation is from *ερύω*, to draw, and *πελας*, near; but this is very fanciful and improbable. It is much more likely that *ερυθρος*, red, is the source.

Nos. SYN. *Ερυσιπελας*: Hipp. Gal. *Επιφλογισμα*: Hipp. *Ignis sacer*: Cels. *Febris erysipelacea*: Hoffm. Vog. *Febris erysipelatos*: Sydenh. Mach. Rosa: Sennert. *Erysipelas*: Sauv. Linn. Cull. Sag. Young, Swed. *Emphylysis erysipelas*: Good. *Ignis Sancti Antonii*: Auct.

VERN. SYN. Gr. *Ερυσιπελας*. Lat. *Ignis sacer*. Eng. Erysipelas, the rose, St. Anthony's fire. Scot. A blast. Ger. Rose, rothlauf. Dut. Roos, St. Anthoni's vuur. Dan. Rosen. Swed. Rosen, helig eld, gamla. Polon. Roza. Fr. Erysipèle, feu de St. Antoine, la rose. Ital. Risipola, fuoco di S. Antonio. Span. Erisipela, rosa.

1560 *Ellinger, And.* De erysipelate. *Lips.* 8vo.

(See INFLAMMATION.)

ERYTHEMA.

DERIV. *Gr.* ερυθμα, redness, a blush; also, an inflammatory blush, or erysipelas; from the same root as ερυσιπελας.

NOS. SYN. *Gr.* Ερυθμα: *Hipp.* Erythema: *Sauv.* Sag. *Swed.* Good. *Erysipelas*: *Auct. Hieropyr*: *Vog.* Phlogosis erythema: *Cull.* Inflammatio erythema, Cauma erythematicum: *Young.*

VERN. SYN. *Gr.* Ερυθμα. *Lat.* Rubor, inflammatio. *Eng.* Rash, blush, the rose. *Ger.* Hitze, flugfeuer, rothlaufgeschwulst. *Dut.* Roodvonk. *Swed.* Rödska. *Fr.* Erythème, feu volage. *Ital.* Riscaldamento, rubore, eritema. *Span.* Fuego.

(For Literature, see INFLAMMATION.)

EXANTHEMA—EXANTHEMATA.

DERIV. *Gr.* εξανθημα, (plur. εξανθηματα,) a blossom, a blister or eruption; from εξανθω, to effloresce, to break out: *Th.* εἶ, and ανθος, a bud or blossom.

NOS. SYN. Εξανθημα, Εξανθησις: *Hipp.* Phlegmasiæ exanthematicæ: *Sauv.* Exanthemata: *Sag.* *Cull.* *Parr.* *Swed.* *Frank.* Exanthematica: *Good.* Morbi exanthematici: *Linn.* Febres exanthematicæ: *Vog.* *Ludwig.* Phlegmasiæ cutaneæ: *Pinel.* Epiphymata: *Young.*

VERN. SYN. Εξανθημα, εξανθηματα. *Lat.* Eruptiones. *Eng.* Eruptions, eruptive diseases, rash. *Ger.* Ausschlag. *Dut.* Uitslag. *Dan.* Udslag, udslæt. *Swed.* Utslag. *Fr.* Exanthème, efflorescence. *Ital.* Esantemi. *Span.* Escupiduras, exantemas.

(For Literature, see the individual diseases.)

FAVUS.

DERIV. *Lat.* favus, a honey-comb, applied by metonymy to the eruption so called.

NOS. SYN. Κηριον: *Auct. Græc.* Favus: *Vog.* Tinea favosa: *Astruc, Sauv.* Scabies capitis favosa: *Plenck.* Porrigo favosa: *Batem.* Porrigo, Achor: *Auct. Var.*

(For Literature, see SKIN, DISEASES OF.)

FEIGNED AND FACTITIOUS DISEASES.

VERN. SYN. *Gr.* Νοσὶ πλαστοί, υποποιετοί. *Lat.* Morbi ficti, simulati. *Eng.* Feigned diseases. *Ger.* Erdichteten krankheiten. *Dut.* Geveinsde ziekten. *Fr.* Maladies feintes, simulées. *Ital.* Malattie finte, simulate. *Span.* Enfermedades fingidas.

N.B. The practice of feigning disease is technically termed in the British navy skulking, and in the army malingering.

FEVER.

DERIV. Lat. *febris*, from *ferveo* or *ferbeo*, to be hot; from which last form of the verb comes *ferbis*, and by an easy metathesis, *febris*.*

I. FEVER IN GENERAL.

NOS. SYN. Πυρετος, πυρεξις (the disease): Auct. Græc. *Febris* (the disease): Auct. Lat. *Pyrexia* (the class): Cull. Parr. Young. *Febres* (the class): Sauv. Vog. Sag. Mach. Cull. Crich. Pin. Swed. *Pyrectica* (the class): Good. *Morbi febiles* (the class): Linn.

VERN. SYN. Gr. Πυρετος, πυρεξις, πυρετικον νοσημα. Lat. *Febris*. Eng. *Fever*. Ger. *Fieber*. Dut. *Koorts*. Dan. *Feber*. Swed. *Feber*. Fr. *Fièvre*. Ital. *Febbre*. Span. *Fiebre*, *calentura*.

II. THE CONTINUED FEVER OF TEMPERATE CLIMATES.

NOS. SYN. Συνοχος, τυφος, καυσος, πυρετος τυφωδης, πυρετικον: Auct. Græc. *Febris continens*, *Febris ardens*, *Febricula*, *Ephemera*: Auct. Lat. *Febris continens*, *F. pestilens*, *F. putrida*, *F. continua*, *F. contagiosa*, *F. nervosa*, *F. petechialis*, *F. lenta*, *F. maligna*, *F. ardens*, *F. acuta*, *F. cererum*, *F. diaria*, *F. septenaria*, *F. castrorum*, *F. lypeiria*, *F. pituitosa*, *F. nosocomialis*, *F. inflammatoria*, *F. Hungarica*, *F. irritativa*, *F. sthenica*, *F. asthenica*, *F. imputris*, *Synocha*, *Synochus*, *Ephemera*, *Typhus*, *Typhodes*, *Morbus mucosus*, *Cauma*, *Causus*: Auct.

VERN. SYN. Gr. Πυρετος συνεχης, συνοχος. Lat. *Febris ardens*, *f. continens*, *f. lenta*, *f. acuta*, *f. mala*. Eng. *Continued fever*, *malignant f.*, *putrid f.*, *jail f.*, *jail distemper*, *simple f.*, *inflammatory f.*, *nervous f.*, *adynamic f.*, *ardent f.*, *epidemic f.*, *infectious f.*, *contagious f.* Ger. *Anhaltendes fieber*, *bosartige fieber*, *kerkerfieber*, *lägerfieber*, *entzündliche fieber*, *nervenfieber*, *gallenfieber*, *schleimfieber*, *hitziges fieber*, *gefässfieber*, *eintägige fieber*, *faulfieber*, *entzündungsfieber*. Dut. *Geduuunge koorts*, *kwaadartige koorts*, *brandende koorts*. Fr. *Fièvre continue*, *f. continuelle*, *f. putride*, *f. nerveuse*, *f. muqueuse*, *f. adynamique*, *f. asthenique*, *f. ataxique*, *f. d'hôpital*. Ital. *Febbre continua*, *tifo*, *febbre putrida*. Span. *Fiebre continua*, *calentura continua*, *efemera*, *causon*, *sinoca*, *calentura putrida*, *tabardillo*, *tifo*.

III. FEVERS OF TYPE: REMITTING AND INTERMITTING FEVERS.

A. Intermittent fever generally.

NOS. SYN. Διαλειπων πυρετος: Hipp. *Febres periodice*: Plin. *Febres intermittentes*: Sauv. Vog. Linn. Sag. Cull. Crich. Swed. *Febres remittentes*: Auct. *Febris intermittens*: Mach. Parr. *Anetus*: Good, Young. *Dialeipyra*: Swed.

* "Appellamus a calendo calorem, a fervore febrim." Varr. apud Non. c. i. n. 225.

VERN. SYN. Gr. Διαλειπων πυρετος. Lat. *Febris periodica*. Eng. *Ague*, *intermittent fever*, *marsh fever*, *fen fever*. Ger. *Wechselfieber*, *kaltesfieber*. Dut. *Gaande en komende koorts*, *verpoozende koorts*. Dan. *Vexelfeber*, *koldfeber*. Swed. *Vexelfeber*, *frossfeber*, *frossa skälftva*. Fr. *Fièvre d'accès*, *fièvre intermittente*. Ital. *Febbre intermittente*. Span. *Calentura intermitente*.

B. Remittent fever generally.

NOS. SYN. *Febres remittentes*: Sauv. Sag. Linn. *Febres intermittentes*: Cull. *Febris remittens*: Mach. *Febres exacerbatantes*: Linn. *Epanetus*: Good. *Helopyra*: Swed. *Febres continuæ remittentes*: Boerh. Swed. *Febres periodica*: Sennert. *Febres proportionatæ*: Torti. *Febres continentes*: Morton. *Amphemerina*, *Tritæophya*, *Tetartophya*, *Tritæus*, *Hemitritæa*: Sauv. Linn. Vog. Crich.

VERN. SYN. Lat. *Febris consistens*. Eng. *Remitting fever*. Ger. *Nachlassendes fieber*, *remittirendes fieber*. Fr. *Fièvre rémittente*. Ital. *Febbre remittente*. Span. *Calentura remittente*.

C. Quotidian intermittent.

NOS. SYN. Αμφημερινος πυρετος: Hipp. *Febris quotidiana*: Cels. Sauv. Linn. Vog. Sag. Cull. *Anetus quotidianus*: Good. *Anetus quotidiana*: Young. *Dialeipyra quotidiana*: Swed. *Amphemerina*: Sauv. Linn. Sag. *Quotidiana continua* (remitting, or imperfectly intermitting): Vog.

VERN. SYN. Gr. Πυρετος αμφημερινος, πυρετος καθημερινος. Lat. *Febris quotidiana*. Eng. *Quotidian ague*, *quotidian*. Ger. *Tägliche fieber*, *alltägliche fieber*. Dut. *Alledaagsche koorts*, *dagelyksche koorts*. Fr. *Fièvre quotidienne*. Ital. *Febbre quotidiana*. Span. *Calentura cotidiana*.

D. Tertian intermittent.

NOS. SYN. Τριταιος πυρετος: Hipp. *Febris tertiana*: Cels. Sauv. Linn. Vog. Sag. Cull. *Tritæophya*: Sauv. *Tritæus*: Linn. *Anetus tertianus*: Good. *Anetus tertiana*: Young. *Dialeipyra tertiana*: Swed.

VERN. SYN. Gr. Πυρετος τριταιος. Lat. *Febris tertiana*. Eng. *Tertian ague*, *tertian*, *tertian fever*. Ger. *Dreitägige fieber*, *dritt-tägige fieber*. Dut. *Anderandaagsche koorts*. Fr. *Fièvre tierce*. Ital. *Febbre terzana*, *terzana*. Span. *Calentura terciaria*, *terciana*.

E. Quartan intermittent.

NOS. SYN. Τεταρταιος πυρετος: Hipp. *Febris quartana*: Cels. Sauv. Linn. Vog. Sag. Hoffm. Junck. Cull. *Anetus quartanus*: Good. *Anetus quartana*: Young. *Dialeipyra quartana*: Swed.

VERN. SYN. Gr. Πυρετος τεταρταιος. Lat. *Febris quartana*. Eng. *Quartan ague*, *quartan*. Ger. *Viertägige fieber*, *quartan fieber*. Dut. *Derdendaagsche koorts*. Fr. *Quartaine*, *fièvre*

quarte. *Ital.* Febbre quartana, quartana. *Span.* Calentura cuartana, cuartana.

F. Yellow fever.

Nos. SYN. *Καυρός?* Hipp. *Typhus icterodes*: Sauv. Cull. *Triteaophya Americana*: Sauv. *Febris flava*: Auct. plur. *Epanetus malignus flavus*: Good. *Febris remittens icterodes*: Parr. *Synochus icterodes*: Young. *Ochropyra*: Swed. *Causus*: Moseley. *Febris flava Americanorum*: Frank.

VERN. SYN. *Gr.* *Καυρός?* *Lat.* *Febris ardens*. *Eng.* Yellow fever, black vomit, bilious remitting fever, Bulam fever. *Ger.* Gelbes fieber, schwartzes erbrechen, Westindisches fieber. *Fr.* Fièvre jaune, fièvre gastro-adyamique, typhus jaune, fièvre matelotte, mal de Siam. *Ital.* Febbre gialla. *Span.* Fiebre amarilla, vomito negro, vomito prieto.

G. Hectic fever.

Nos. SYN. *Επτικός πυρετός*: Hipp. *Febris hectica*: Sauv. Linn. Vog. Sag. Cull. Macb. *Hecticopyretos*: Auct. *Epanetus hectica*: Good. *Febris lenta*: Junc. Hoffm. *Amphemerina hectica*: Crich. *Hectica*: Young. *Marasmopyra*, *Hecticopyra*: Swed.

VERN. SYN. *Gr.* *Επτικός πυρετός*. *Lat.* *Febris longa*, tabes, atrophica. *Eng.* Hectic fever, hectic. *Ger.* Hektisches fieber, schleichendes fieber, zehrungsieber. *Dut.* Uitteerende koorts, uitdroogende koorts, teeringkoorts. *Dan.* Tærende feber. *Swed.* Tränfeber. *Fr.* Fièvre étique, fièvre hecticque. *Ital.* Etica febbre, etica. *Span.* Etica, calentura hetica.

H. Puerperal fever.

Nos. SYN. *Febris puerperalis*: Auct. *Synochus puerperarum*: Good. *Dystocia febrilis*: Young. *Peritonitis*, *Metritis*, *Hysteritis*: Auct.

VERN. SYN. *Eng.* Childbed fever, puerperal fever. *Ger.* Kindbettfeber. *Dut.* Kinderbedkoorts, kraambetkoorts. *Fr.* Fièvre puerpérale, péritonite puerpérale. *Ital.* Febbre puerperale. *Span.* Calentura puerperale.

I. FEVER IN GENERAL.

IV. PUERPERAL FEVER.

See (in lit. P) PUERPERAL FEVER.

FUNGUS HÆMATODES.

DERIV. A nosological term, compounded of a Latin noun and Greek adjective. Lat. *fungus*, a mushroom, a morbid excrescence on trees; also the morbid growth of granulations in ulcers, termed in English *proud flesh*: Gr. *αιματώδης*, *αιματοειδής*, bloodlike, from *αιμα*, blood, and *ειδος*, form or appearance.

Nos. SYN. *Fungus hæmatodes*: Hey, Wardrop. *Spongoid inflammation*: Burns. *Sarcoma medullare*: Abernethy. *Carcinus spongiosus*: Good. *Carcinoma spongiosum*: Young. *Fungus medullaris*: Gunther. *Soft cancer*: Wardrop. *Milk-like tumour*: Monro. *Encephaloïde*, *Tumeur encéphaloïde*, *Tumeur cérébriforme*, *Cancer mou*, *Matière encéphaloïde*, *Matière cérébriforme*: Laennec, Auct. Gall. *Blutschwamm*: Germ.

1800 *Burns, J.* Dissertations on inflammation, vol. 2. Glasg. 8vo.

1803 *Hey, W.* Practical observations on surgery. Lond. 8vo.

1809 *Wardrop, Jas.* Observations on fungus hæmatodes or soft cancer. Edin. 8vo.

1815 *Laennec*, Dict. des Sc. Méd. (art. *Encephaloïdes*) t. xii. Par.

1819 *Laennec*, Traité de l'auscultation médiate (chap. *Encephaloïdes du poulmon*) Par. 8vo.

1820 *Mainoir, J. P.* Mémoire sur les fungus medullaire et hématoïde. Par. 8vo.

1821 *Bartley, C. F. E.* Observations singuliers fungi medullaris in corde. Halle, 8vo.

1830 *Begin*, Dict. de Méd. Prat. (art. *Cancer*) t. iv. Par.

1833 *Kerr, Cyc. of Pract. Med.* (art. *Fungus hæmatodes*) vol. ii. Lond.

(See SCIRRHUS.)

GALVANISM.

DERIV. From *Galvani*, the name of its discoverer.

(For the Literature, see ELECTRICITY.)

GASTRALGIA AND GASTRODYNIA,

See CARDIALGIA.

GASTRITIS.

DERIV. Gr. *γαστήρ*, the stomach, and the nosological termination indicating inflammation.

Nos. SYN. *Ventriculi inflammatio*: Boerh. *Gastritis*: Sauv. Linn. Vog. Sag. Cull. Mach. Parr, Darw. Crich. Pin. Swed. *Febris stomachica inflammatoria*: Hoffm. *Cardialgia inflammatoria*: Tralles. *Cauma gastritis*: Young. *Empresma gastritis*: Good.

VERN. SYN. Lat. *Inflammatio ventriculi*. Eng. Inflammation of the stomach. Ger. Entzündung des magens, magenentzündung. Dut. Maagbrand. Fr. Inflammation de l'estomac, gastrite. Ital. Inflammazion di stomaco, gastrite. Span. Inflamacion d'estomago.

GASTRO-ENTERITIS.

DERIV. A nosological compound, formed from *γαστήρ*, the stomach, *εντέρα*, the intestines, and the terminal particle *itis*: inflammation of the stomach and bowels. *Gastro-entérite*, Broussais.

1706 *Hoffmann, Fr.* Dissertatio de inflammatione ventriculi frequentissima (Opp. t. vi.) Hal.

GOUT, (PODAGRA, ARTHRITIS.)

DERIV. *Gout*. From the French *goutte*, a drop, itself from the Latin *gutta*, signifying the same, applied to the disease from the theoretical notion of the old pathologists, of a morbid drop being the cause.

Podagra. Gr. *ποδαγρα*, from *πους*, the foot, and *αγρα*, prey that is caught, *quasi* foot-prey, foot-game, by a clever and natural metonymy applied to the disease termed gout.

Arthritis. Gr. *αρθριτις*, pain in the joints, from *αρθρον*, a joint, applied both to gout and rheumatism by the ancients.

NOS. SYN. *Αρθριτις*, *Ποδαγρα*, *Ποδαλγία*: Auct. Græc. *Morbus articularis*: Plin. *Gutta*: Bartholin, et Auct. Lat. rec. *Arthritis*: Sauv. Linn. Vog. Sag. Macb. *Podagra*: Boerh. Vog. Cull. Pin. Swed. *Arthrosia podagra*: Good. *Arthritis podagra*: Parr. *Febris podagrica*: Vog. *Podagra arthritis*, *Cauma podagricum*: Young. *Arthroncus podagricus*, *Arthrodynia podagrica*: Swed.

VERN. SYN. Gr. *Ποδαγρα*, *αρθριτις*, *αρθριση* or *αρθριτις* *νοσος*. Lat. *Podagra*, *chiragra*, *arthritis*, *morbus articularis*. Eng. The gout. Scot. The gut. Ger. *Zipperlein*, *gicht*, *gliedersucht*, *podagra*, *gichtschmerzen*, *gliederverweh*, *fussgicht*. Dut. *Voeteuvel*, *voet-flecercyn*, *jigt*, *gigt*, *pootjes*, *ledenzucht*. Dan. *Gigt*, *leddepine*, *fodgigt*. Swed. *Gickt*, *ledvärk*, *fotsjuka*. Fr. *Goutte*, *arthrite*. Ital. *Gotta*, *podagra*. Span. *Gota*, *arthritis*.

HEPATALGIA—HEPATITIS.—LIVER, DISEASES OF, INFLAMMATION OF.

HEPATALGIA.—I. Pain in the liver.

DERIV. From *ἥπαρ*, gen. *ἥπατος*, the liver, and *ἀλγέω*, to suffer pain: pain in the liver.

NOS. SYN. *Hepatalgia*: Sauv. Sag. Swed. *Hepatica*: Linn. Dolor hypochondrii dextri: Bonet.

VERN. SYN. Eng. Pain in the liver. Ger. Schmerzen der leber. Fr. Douleur du foie.

II. Swelling of the liver.

NOS. SYN. *Hepatalgia infarcta*: Sauv. *Hepa-*

talgia scirrhusa: Sauv. *Scirrhus hepatis*: Hall. *Hepatalgia sarcomatosa*: Manget. *Tumor hepatis*: Sennert. Darw. *Infarctus hepatis*: Junck. *Physconia hepatica*: Sauv. Cull. Parr. *Parabysma hepaticum*: Good. *Hepatoculus*: Swed.

VERN. SYN. Eng. Liver disease, the liver, enlarged liver. Ger. Riedtkuchen. Fr. Scirrhe au foie, obstruction du foie, excroissance du foie.

HEPATITIS.—Liver, inflammation of.

DERIV. *Hepatitis*. Gr. *ἥπατιτις*, from *ἥπαρ*, *ἥπατος*, the liver. The term is used by Galen in the present sense, but it is more usually employed adjectively, with the sense of *hepatic*. The Latin word *hepatitis* is only used, according to Pliny, as “gemmæ nomen a figura jecinoris.”

NOS. SYN. *ἥπατιτις*, *ἥπετος*, *ἡπεριωδης*. Gal. *Νοσος ἥπατις*: Græc. *Morbus jecinoris*, *Suppuratio in jecinore*, *Jecoris vomica*: Cels. *Inflammatio hepatis*: Sennert. Etmull. *Hepatitis*: Sauv. Linn. Vog. Sag. Boerh. Hoffm. Macb. Junck. Cull. Swed. *Hepatalgia apostematosa*: Sauv. *Empresma hepatitis*: Good. *Cauma hepatitis*: Young. *Hepatalgia*: Auct.

VERN. SYN. Gr. *ἥπατιτις*, *νουςος ἥπατις*. Lat. *Inflammatio jecinoris*, *morbus jecinoris*. Eng. *Hepatitis*, liver disease, the liver, liver complaint. Ger. Entzündung der leber, leberentzündung, leberkrankheit. Dut. Ontsteeking in de lever. Fr. Inflammation du foie, hépatite, la pièce. Ital. Inflammazion di fegato, epatite. Span. *Hepatitis*, inflamacion de higado.

HERPES.

DERIV. Gr. *ερπης*, from *ερπω*, to creep, from the progressive extension of the eruption: also *ερπιδων*, from the same root.

Nos. SYN. *Ερπης*: Galen. Dioscor. Cels. *Ερπιδων*: Nicand. *ζωστήρ* (literally a zone or belt, hence applied to the form of herpes termed shingles; *herpes zoster*): Plin. *Herpes*: Plin. Lucil. *Zona*: Scribon. Sag. Russel. *Ignis sacer*: Cels. *Formica*: Avicen. *Cytisma herpes*: Young. *Lepidosis herpes*, *Ecpchylis herpes*: Good. *Herpes*: Sauv. Linn. Willan. *Zona ignea*: Hoffm. Darw. *Herpes zoster*: Hoffm. Sauv. Batem. *Hioropyr*: Vog. *Erysipelas phlyctænodes*: Cull. *Erysipelas zoster*: Sauv. *Serpigo*: Auct.

VERN. SYN. Gr. *Ερπης*, *ερπιδων*, *ζωστήρ*. Lat. *Herpes*, *zona*, *ignis sacer*. Eng. *Herpes*, the shingles, the serpigo, tetter. Ger. *Zittermal*, *flechte*, *feuergürtel*, *der gürtel*. Dut. *Springend vuur*, *zeker zeer*. Fr. *Dartre*, *herpe*, *la jartière*, *ceinture dartreuse*. Ital. *Erpete*. Span. *Herpes*, *sarpullido*.

(For Literature, see SKIN, DISEASES OF.)

HICCUP—HICCOUGH—SINGULTUS.

DERIV. *Hiccup* and *hicough*, original English words, no doubt formed from resemblance to the sound characteristic of the affection. The same is true of the now obsolete English words *yex* and *yelk*, and the Greek and Latin synonyms *λυγξ* and *singultus*, as well as of the vernacular term in most languages.

Nos. SYN. *Λυγξ*, *λυγμος*, *λυγγος*: Hipp. et Auct. Græc. *Singultus*: Plin. Sauv. Linn. Vog. Sag. *Pneusis singultus*: Young. *Clonus singultus*: Good. *Lygmus*: Swed.

VERN. SYN. Gr. *Λυγξ*, *λυγμος*, *λυγγος*. Lat. *Singultus*. Eng. *Hiccup*, *hicough*, *yex*, *hocket*,

HOOPING-COUGH—CHINCOUGH—PERTUSSIS.

DERIV. Hooping or whooping-cough, a vernacular English term, derived from the verb *to whoop* or *hoop*, to call with a loud noise.

Chincough, perhaps more properly *kincough*, from *kincken*, to cough; (Johnson.)

Pertussis, from *per*, augment. and *tussis*, an intense cough.

Nos. SYN. *Θηριωδης βηξ*? Hipp. Gal. *Pertussis*: Sydenh. Huxh. Cull. Darw. Crich. Swed. *Tussis convulsiva*: Sauv. *Tussis ferina*: Hoffm. Swed. *Tussis clangosa*: Bourdelin. *Bex convulsiva*: Good. *Pneusis pertussis*: Young. *Bex theriodes* (*βηξ θηριωδης*): Auct. *Bronchitis epidemica*: Marcus. *Bronchis convulsiva*: Prunel. *Broncho-cephalitis*: Desruelles.

VERN. SYN. Gr. *Θηριωδης βηξ*. Lat. *Tussis convulsiva*. Eng. Whooping-cough, hooping-cough, chincough, chinecough, convulsive cough. Scot. Kinkhost. Ger. Keichhusten, starker husten, krampf Husten, kikhusten. Dut. Kinkhoest, klankhoest. Dan. Krampehoste, kighoste. Swed. Kramphosta, kikhosta. Fr. Coqueluche, tac, horion, catarrhe convulsif, bronchite convulsive. Ital. Pertosse, tosse convulsiva, tosse canina. Span. Romadizo maligno, tos convulsivo.

1732 *Hoffmann, Fr.* Dissertatio de tussi convulsiva (Opp. Suppl. ii. de tussi iii.) *Hal.*

1738 *Savoye, Al. (Stoll)* De tussi convulsiva (Eyerell ii.) *Vien.* 8vo.

HYGIENE.

HYGEIENE, HYGIASTICS, HYGIOLOGY, PRESERVATION OF HEALTH.

DERIV. The word *health* is a modification of the original Saxon *hael*: it conveys only a part of the meaning conveyed by the Greek deriva-

vatives given above. The want of an English term to convey this meaning has been long felt, and is not yet quite satisfactorily supplied, although the first of the Greek derivatives above given, *hygiene*, or *hygieine*, (Gr. *υγιεινη*) adopted by us immediately from the French, seems now in a fair way to be naturalized. It is not, however, very *English* either in its form or sound; and but for its pretty general adoption by recent writers, one might be disposed to propose *hygiology* as a substitute of somewhat more vernacular aspect and sound. All these words are derived from the same root:—*υγιος*, healthy; *υγιεια* or *υγεια*, health; *υγιεινός*, *υγιειν*, relating to or conducive to health, wholesome; *υγιεινη*, *hygiene*, that part of medicine which regards the preservation of health.

VERN. SYN. Gr. *Τυγιεινη*. Eng. Preservation of health, *hygiene*. Ger. *Erhaltung der gesundheit*. Dut. *Bewaaring der gezondheid*. Fr. *Hygiène*.

ICHTHYOSIS.

DERIV. A nosological term formed from *ἰχθυς*, a fish. The termination *iasis*, adopted by Dr. Good, is more accordant with the analogy followed in the formation of similar names.

NOS. SYN. *Impetigo excorticativa*, Albaras nigra: Avicen. *Lepra ichthyosis*: Sauv. *Ichthyosis*: Will. *Lepidosis ichthyiasis*: Good. *Lepidosis ichthyosis*: Young.

VERN. SYN. *Eng.* Fish-skin. *Ger.* Fischschuppen.ausschlag, fischschuppen.aussatz. *Fr.* Ichthyose. *Ital.* Ictiosi. *Span.* Zapa.

(For Literature, see SKIN, DISEASES OF.)

IMPETIGO.

DERIV. Lat. *impetigo*, from *impeto*, to attack or infest.

NOS. SYN. *Αἰχμή*: Galen. *Impetigo*: Cels. Plin. Will. Batem. Vog. *Phlysis impetigo*: Young. *Ecpyesis impetigo*: Good. *Lepra squamosa*, *Herpes*, *Vitiligo*, *Lichen*, *Phlyctena*: Auct.

VERN. SYN. *Αἰχμή*, *αλφός*. Lat. *Impetigo*. *Eng.* Tetter, humid or running tetter. *Ger.* Zittermal, ringwurm. *Dut.* Schurftheid, ringworm. *Dan.* Ringorm. *Swed.* Ringorm. *Fr.* Dartre, dartre crustacée, tique. *Ital.* Impetigine. *Span.* Empeine.

(For Literature, see SKIN, DISEASES OF.)

INCONTINENCE OF URINE,

ENURESIS.

DERIV. *Enuresis*, from *ενουρεω*, to make water involuntarily; or from *εν*, and *ουρησις*, the act of making water.

NOS. SYN. *Περιρροια*: Hipp. *Παρεσις*: Aret. *Στραγγουρια*: Gal. *Incontinentia urinæ*: Plin. *Stillicidium urinæ*: Sennert. *Enuresis*: Sauv. Linn. Vog. Sag. Cull. *Hyperuresis*: Young. *Paruria incontiens*: Good. *Uraerasia*: Swed. *Uorrhæa*, *Uracratia*: Ploucq.

VERN. SYN. *Gr.* *Περιρροια*, *παρεσις*. Lat. *Incontinentia urinæ*. *Eng.* Incontinence of urine. *Ger.* Unwillkührlicher harnabgang, harnfluss. *Dut.* Pisontlooping. *Dan.* Urinflod. *Swed.* Pinkgång. *Fr.* Incontinence d'urine, flux d'urine. *Ital.* Incontinenza d'urina. *Span.* Incontinencia de orina.

(For Literature, see URINE, and URINARY ORGANS, DISEASES OF.)

INCUBUS, EPHALTES.

DERIV. Lat. *incubus*, from *incubo*, to lie upon, to brood.

NOS. SYN. *Πιγαλιών*: Themison. *Πιγμός ενυπ-*

νιος: Dioscor. Πυγαμεων: Paul.-Ægin. *Incubo*: Coel.-Aurel. Scrib.-Larg. *Epibole* (επιβολη): Coel.-Aurel. *Incubus*: Vog. Junck. Cricht. *Oneirodymia gravans*: Cull. *Ephialtes*: Linn. Sag. Sauv. Ploucq. *Ephialtes nocturnus*: Good. *Erethismus onirodymia*: Young. *Paigalion*: Swed. *Asthma nocturnum*, *Epilepsia nocturna*, *Succubus*: Auct.

VERN. SYN. Gr. Εφιάλτης, επιβολη, πνιγαλιον. Lat. Incubus, incubo, ephialtes, ludibria Fauni. Eng. Nightmare. Ger. Alp. nachtmännchen, alprücken. Dut. Nachmerrie, nachtdrukking, alp. Dan. Maren, mareriden. Swed. Mara. Fr. Cauchemar, cochemar, incube, cocheville. Ital. Pesarolo. Span. Pesadilla, mampesado, mampesadilla.

1751 Bond, J. De incubo (Smellie Thes. ii. 1.) Edin. 8vo.

1753 Bond, John, M.D. An essay on the incubus or night-mare. Lond. 8vo.

1833 Strahl, Der alp, seine heilung, &c. Berlin, 8vo.

INDIGESTION, See DYSPEPSIA.

INFANTICIDE.

DERIV. From the Lat. *infanticidium*, from *infans* and *cædo*.

SYN. Gr. Βρεφοκτονια (from βρεφος, an infant, and κτεινω, to kill.) Lat. Infanticidium. Eng. Child-murder, infanticide. Ger. Kindermord, kindermörder. Dut. Kinder-moord. Fr. Infanticide. Ital. Span. Infanticidio.

(For the Literature, see JURISPRUDENCE MEDICAL.)

INFECTION.

DERIV. From the Lat. *infectio*, (from *infectio*, to stain, to imbue,) although the word is not used classically in this sense.

SYN. See CONTAGION.

(For the Literature, see CONTAGION.)

INFLAMMATION.

DERIV. From Lat. *inflammatio*, burning, from *flamma*, a flame.

VERN. SYN. Gr. φλογωσις, φλεγμωνη, φλεγμανσις, φλεγμασια. Lat. Inflammatio, phlegmone. Eng.

Inflammation. Ger. Entzündung. Dut. Ontsteking, verhitting, brand. Dan. Betændelse. Swed. Brand. Fr. Inflammation, phlegmasie. Ital. Inflammatione. Span. Inflamacion.

ISCHURIA—SUPPRESSION OF URINE.

DERIV. Gr. *ισχυρια*, a suppression or retention of urine, from *ισχ α* , to withhold, and *ουρον*, the urine.

NOS. SYN. *ισχυρια*: Hipp. Gal. Paul. Ægin. *Ischuria*: Sauv. Linn. Vog. Sag. Macb. Cull. Ploucq. Young. *Ischuria renalis*, *Ischuria vesicalis*, *Ischuria urethralis*: Cull. *Urinæ suppressio*, *Urinæ retentio*: Hoffm. *Paruria inops*, *Paruria retentionis*: Good. *Hydrops vesicæ*: Auct.

VER. SYN. Gr. *ισχυρια*. Lat. *Ischuria*, *urinæ suppressio*. Eng. *Retention*, *suppression*, *stoppage of urine*, *ischury*. Ger. *Harnverstopfung*, *verhaltung des harns*, *harnverhaltung*. Dut. *Pisopstopping*, *pisopschorting*, *opgestopte pis*. Dan. *Pisstandsning*. Swed. *Vattenhäfta*, *vatten-*

stamma. *Fr.* Suppression d'urine, rétention d'urine. *Ital.* Rattenimento delle orine. *Span.* Retencion de orina.

(For Literature, see URINE, and URINARY ORGANS, DISEASES OF.)

JAUNDICE—ICTERUS, AURIGO, MORBUS REGIUS.

DERIV. *Jaundice*, most probably a corruption of the French word *jaunisse*, itself from *jaune*, yellow; *jaun-isse*, quasi *yellow-ness*.

ICTERUS. Gr. *ικτερος*. Various explanations have been attempted of the derivation of this word. By Pliny and Cœlius Aurelianus it is derived from the bird, of a yellow colour, termed by the Greeks *ικτερος*, and the Romans *galbulus* or *galbula*, probably the *oriolus galbula* of Linnæus; the looking upon which bird by the jaundiced person is said by the first-named author to be a cure for the disease and at the same time death to the bird. Others, with certainly much less probability, would deduce the name from *ικτις*, a ferret, from the colour of this animal's eyes.

Aurigo or *Aurigo*. This term is in all probability derived from *aurum*, gold, on account of its colour, as stated by Varro.

Arquatus morbus. This name is formed on the same general principle of analogy of colour, from the supposed resemblance of the colour of jaundice to that of the rainbow—*arquatus*, arched, applied to the rainbow.

Regius morbus, royal disease; so called, according to Celsus, Varro, &c., because it is best cured by the appliances and means familiar in the palaces of kings—

“Regius est vero signatus nomine morbus,
Molliter hic quoniam celsa curatur in aula.”
Seren. Sammon.

NOS. SYN. *ικτερος*: Hipp. Gal. *Morbus regius*, *Morbus arquatus*: Cels. *ICTERUS*: Linn. Vog. Boerh. Cull. Good, Mach. Junck. Swed. *Aurigo*: Sauv. Sag. *Cachexia icterica*: Hoffm. *Cholelithia icterus*: Young.

VERN. SYN. Gr. *ικτερος*. Lat. *Aurigo*, *aurigo*, *morbus arquatus*, *morbus regius*. Eng. *Jaundice*. Scot. *Gulschoch*, *gulset*. Ger. *Gelbsucht*. Dut. *Geelzucht*, *gelun*, *geele*. Dan. *Guulsot*. Swed. *Gulsot*, *galsjuka*. Fr. *Jaunisse*, *ictère*. Ital. *Iterizia*, *citrinezza*. Span. *Ictericia*, *tericia*.

(See FEVER, Intermittent and Remittent.)

MALFORMATION OF THE HEART,

See HEART, DISEASES OF.

MEASLES—RUBEOLA, MORBILLI.

DERIV. *Measles*. This is a very ancient English word, and, if not derived from some of the

continental synonyms, is at least from the same original stock, and means essentially *mottled*, *speckled*, or of various colours. It is worthy of notice that *measled* or *measly* (pronounced *mizzled*, *mizzly*) is the term applied in Scotland to the mottled state of the skin produced by exposure of the bare limbs to a hot fire, while the word *mirles* given to the disease now under consideration has likewise the same meaning, *mirly*, *mirled*, or *mirlet*, being synonymous with the English adjectives speckled or spotted.

Rubeola. This term, according to Dr. Good, is derived from the Spanish *rubio*, red, and was originally written *rubiola*, but was afterwards changed to *rubeola* in order to entitle it to the claim of a Latin source, viz. *rubeus*, red, or rather *rubeo*, to be red, to blush. It may, however, be worthy of notice that the Italians give the name of *rubiola* to a species of grape.

Morbilli. This term also, or its congener *morbillo*, is, according to Dr. Good, Spanish, a diminutive of *morbo*; and although he does not state his authority, it seems probable that the measles acquired this appellation when compared with the greater malady, the small-pox, with which they had long been confounded.

Nos. SYN. *Blaccia*: Aaron. *Rubeola*: Sauv. Linn. Sag. Cull. Darw. Swed. *Morbilli*: Sydenh. Morton, Junck. Vog. Macb. Pin. Cricht. *Febris morbillosa*: Hoffm. *Cauma rubeola*: Young. *Exanthesis rubeola*: Good. *Phenicismus*: Ploucq. *Synocha morbillosa*: Cricht. *Rosola*: Auct.

NOLI ME TANGERE—LUPUS.

DERIV. *Noli-me-tangere*, Lat. touch-me-not, so called from its impatience of all handling, and its being aggravated instead of relieved by most kinds of treatment. The same name is given to certain plants which shed their seeds on being touched, as the *impatiens*, *noli-me-tangere* of Linnæus, but whether before or after the nomination of lupus I do not know.

Lupus, Lat. the wolf; the name applied from the rapid destruction of parts in this disease.

NOS. SYN. *Cancer lupus*: Sauv. *Ulcus tuberculosus*: Good. *Phymatosis lupus*: Young. *Carcinoma faciei*: Swed.

VERN. SYN. Eng. Lupus, canker. Ger. Krebs, fressende wurm, der wolf.* Dut. Uret, wolf. Fr. Loup, chancre, dartre rongeante.

(For Literature, see SKIN, DISEASES OF.)

NOSTALGIA, NOSTOMANIA, NOSTRASSIA.

DERIV. *Nostalgia*. A nosological compound from *νοστέω*, to return, or *νοστος*, a return home or a journey homewards, and *αλγεια*, to be distressed, or *αλγος*, distress or sorrow—home-sorrow, home-sickness.

Nostomania, from *νοστος* and *μανια*, is the same morbid desire aggravated to madness.

Nostrassia, from the Lat. *nostras*, of our country.

NOS. SYN. *Nostalgia*: Harder, Sauv. Linn. Sag. Cull. Darw. Swed. *Melancholia*: Vog. *Nostomania*, *Pathopatridalgia*: Zwinger. *Philopatridomania*: Harder. *Nostrassia*: Auct.

VERN. SYN. Eng. Home-sickness, mother-sickness. Ger. Heimweh. Dut. Heimwee. Dan. Hiemvee, hiemsyge. Swed. Hemsjuka. Fr. Maladie du pays. Ital. Malattia del paese. Span. Mal de pais.

NYCTALOPIA, HEMERALOPIA.

DERIV. *Nyctalopia*. Gr. νυκταλωπια, from νύξ (gen. νυκτος), night, and σκοπμαι, to see, or ωφ (gen. ωπος), the eye; literally *night-seeing, night-sight*.

Hemeralopia. Gr. ημεραλωπια (not in use), from ημερα, day, and σκοπμαι or ωφ; literally *day-seeing or day-sight*.

These two terms have been inextricably confused, by being taken respectively by different authors to mean the same thing, one terming night-blindness *nyctalopia* and another *hemeralopia*, while day-blindness has been equally designated by both terms. Looking to the simple etymology, *nyctalopia* should be confined to the affection wherein the patient sees comparatively well at night and badly by day, and reversely *hemeralopia*. It will be seen, however, from the list of synonyms, that this appropriation has not by any means been adhered to, and even that the preponderance of authorities is in favour of the reverse nomenclature. Some have thought that the apparent misappropriation of *nyctalopia* to night-blindness may be explained by admitting the use of the α priv. between νύξ and σκοπμαι or ωπος, but this derivation does not seem probable.

I. Vision lost or obscure BY DAY, comparatively good AT NIGHT—night-sight, day-blindness.

NOS. SYN. Νυκταλωπια: Hipp.* Gal.† Νυκταλωφ (the disease): Paul.-Ægin. Νυκταλωπιασις: Oribas. Νυκταλωπηξ: Aristot. *Nyctalopia* (or rather *nyctalops*, the adjective in the same sense): Plin. Ulpian. Dig. Theodor. Priscian. *Nyctalopa*: Marcell. Empir. *Luscitio*: Festus, Seneca.‡ *Nyctalopia*: Linn. Vog. *Amblyopia meridiana*: Sauv. Swed. *Vespertina acies*: Plater. *Visus nocturnus*: Boerh. *Paropsis lucifuga*: Good. *Oxyopia*: Auct. *Photophobia*: Plenck. *Dysopia luminis*: Cull. *Visus acrior*: Darw. *Hemeralopia*: Auct.

VERN. SYN. Gr. Νυκταλωπια. Lat. *Luscitio*, *nyctalopa*. Eng. Day-blindness, night-sight. Ger. Tagblindheit, hühnerblindheit. Dut. Dagblindheid, nagtgezicht. Dan. Nattesyn. Swed. Nattsyn, kattögd. Fr. Nyctalopie, vue de hibou, vue de nuit. Ital. Nittalopia, cecita di giorno. Span. Ceguera de día.

* Οι της νυκτος ορωντες, ους δη νυκταλωπας καλεομεν. Prædict. lib. ii.

† Galen also uses it in the opposite sense: In Isag. c. 15 ad fin. So also would seem to do Hippoc. (Porrhet.) and even Aristot.

‡ Pliny and others use the word in the reverse sense.

II. Vision lost or obscure BY NIGHT, good or comparatively good BY DAY—day-sight, night-blindness.

NOS. SYN. *Hemeralopia*: Vog. Plenck. Bampfield, Simson. *Hemeralops*: Auct. *Visus diurnus*: Boerh. *Amblyopia crepuscularis*: Sauv. Swed. *Nyctalopia*: Auct. Rec. *Paropsis noctifuga*: Good. *Dysopia tenebrarum*: Cull.

VERN. SYN. Eng. Day-sight, night-blindness, hen-blindness. Ger. Tagsehen, nachtblindheit, hemeralopie. Dut. Dagsziende, daggezicht. Dan. Natblende. Swed. Skumöghet. Fr. Aveuglement de nuit, vue de jour. Ital. Emeraldopia, cecita di notte. Span. Ceguera de noche.

PERICARDITIS, CARDITIS.

DERIV. *Carditis*, from *καρδια*, the heart, and the nosological sign of inflammation, *itis*; quasi *καρδιτις*.

Pericarditis, formed in the same manner from *περικαρδιον*, the pericardium, quasi *περικαρδιτις*. The separate inflammation of these two parts has only been recognized by recent pathologists.

Nos. SYN. *Carditis*: Sauv. Vog. Sag. Macb. Darw. Cricht. Pin. Swed. Auct.-rec. *Inflammatio cordis et pericardii*: Senac. *Synochus cardiaca*: De Meyseroy. *Empresma carditis*: Good. *Cauma carditis*: Young. *Pericarditis*: Vog. Pin. Swed. Auct.-rec.

VERN. SYN. Lat. *Inflammatio cordis*. Eng. Inflammation of the heart. Ger. *Hertzbeutel-entzündung*, *hertzentzündung*. Fr. *Inflammation du cœur*. Ital. *Cardite*, *pericardite*, *inflammation del cuore*, *del pericardio*. Span. *Carditis*, *inflamacion del corazon*.

PHYSOMETRA—TYMPANITES UTERI.

DERIV. From *φύσα*, wind, and *μυτρα*, the uterus—wind in the uterus, uterine tympany.

NOS. SYN. *Physometra*: Sauv. Sag. Cull. *Hysterophyse* (υστερα and φύσα): Vog. *Tympanites uteri*: Astruc. *Inflatio uteri*: Sennert. *Emphysema uterinum*: Young. *Emphysema uteri*: Good. *Hysteroncus physodes* (υστερα and ογκος, tumor): Swed.

VERN. SYN. *Eng.* Uterine tympany, air in the uterus. *Ger.* Windsucht der mutter. *Fr.* Tympanite de la matrice.

(For Literature, see UTERUS, DISEASES OF.)

PITYRIASIS.

DERIV. Gr. *πιτυρίασις*, from *πιτυρον*, plur. *πιτυρα*, bran, which last term was applied by the Greeks to the branny scurf found among the hair.

NOS. SYN. *Πιτυρίασις*: Gal. Actuar. Paul. *Porrigo*: Cels. Lorry, Frank. *Pityriasis*: Vog. Willan, Batem. Swed. *Tinea porriginosa*: Astruc. *Ephelis*: Auct. *Furfurisca*: Gilbert. *Tinea furfuracea*: Sennert. *Lepidosis pityriasis*: Young, Good.

VERN. SYN. Gr. *πιτυρίασις*. Lat. *Porrigo*. *Eng.* Dandriff, scurf. *Ger.* Hautkleie, kleien-grind, kleienartiger ausschlag, schuppen, hauptschuppen. *Dut.* Zemelagtigheid, schilfer op het hoofd. *Fr.* Teigne, dartre, dartre furfuracée, teigne de son.

(For Literature, see SKIN, DISEASES OF.)

PLAGUE—PESTIS.

DERIV. The English word *plague*, which is not merely synonymous but identical with the German *plage*, and the Dutch *plaag*,* is either derived directly from the Latin *plaga*, Gr. *πληγή*, a blow, stroke or wound, (from *πλησσω*, to strike,) or both rise from a still remoter root.

The English words *pest*, *pestilence*, and their congeners in the other modern languages (see below), are entirely transferred from the Latin words *pestis* and *pestilentialis*, having precisely the same meaning.

NOS. SYN. *Λοιμός*: Hipp. Gal. *Λοιμώδης πυρετός*: Auct. Græc. *Pestilentia*: Cels. Cæs. Plin. Cic. *Pestis*: Auct.-Lat. Sydenh. Sauv. Linn. Junck. Cull. *Febris pestilentialis*: Hoffm. Vog. *Typhus pestis*: Young. *Anthraxa pestis*: Good. *Exanthema pestis*: Parr. *Loimopyra*: Swed.

VERN. SYN. Gr. *Λοιμός*, *λοιμώδης πυρετός*. Lat. *Pestilentia*, *pestis*. *Eng.* Pest, pestilence, plague. *Ger.* Pest, plage, pestfieber, pestilenz. *Dut.* Plaa, pest, pestkoorts. *Dan.* Swed. Pest, pestilents. *Fr.* Peste, pestilence, fièvre pestilentielle. *Ital.* Peste, pestilenza. *Span.* Peste, plaga, pestilencia.

1507 *Bayrus, Pet. de*, Quæstio nova de peste. *Taurin.* 12mo.

1507 *Vochs, Joan.* De pestilentia anni præsentis ejusque cura. *Magd.* 8vo.

PLETHORA.

DERIV. Gr. πληθωρα, fulness, repletion; from πληθω, to fill, to be full, or πληθος, bulk, size.

NOS. SYN. πληθωρα, πληθος, πληθωρικον σωμα, πληθωρικη διαβασις; Gal. *Plethora*; Linn. *Sag.* Good. *Polychymia*; Swed.

VERN. SYN. Gr. πληθωρα. Lat. *Pletura*, repletura, repletio. Eng. *Plethory*, fulness, full habit of body, redundancy of blood. Ger. Vollblütigkeit. Dut. Bloedrykheid, overvloed van bloed. Dan. Fuldblodighed, blodfyldt. Swed. Blodfylla. Fr. Pléthore, plénitude de sang, surabondance de sang. Ital. *Pletora*, abbondanza di sangue. Span. *Pletora*, replecion de sangre.

1713 *Hoffmann, Fr.* De plethora insufficiente morborum causa (Opp. Suppl. ii.) *Hal.* 4to.

1723 *Fischer, J. A.* Dissertatio de plethora multorum morborum causa. *Erf.* 4to.

PLEURISY, PLEURITIS.

DERIV. The English word *pleurisy* is probably derived immediately from the French *pleurésie*, and both, obviously, from the Latin *pleurisis*, a classical word, but less common than *pleuritis*, which last is a mere transcription of the original Greek πλευριτις, derived from πλευρα, the side, and literally signifying *lateral*, but used absolutely and substantively as the name of the disease in lieu of πλευριτις νοσος, the side disease, or *pleurisy*.

NOS. SYN. πλευριτις; Hipp. *Morbus pleuriticus*; Cels. *Passio pleuritica*; Coel.-Aurel. *Pleuris*; Gordonius, Sydenh. *Pleuritica febris*; Hoffm. *Pleuritica*; Linn. *Pleura furens*; Van-Helm. *Mediastina*; Vog. *Morbus costalis*; Verna. *Pleuritis*; Sauv. Linn. Vog. *Sag.* Boerh. *Junck.* Swed. *Pneumonia pleuritis*; Cull. *Cauma pleuritis*; Young. *Empresma pleuritis*; Good. *Pleuritis pulmonis*, *Pleuripneumonia*, *Pleuroperipneumonia*, *Peripneumo-pleuritis*; Auct.

VERN. SYN. Gr. πλευριτις. Lat. *Pleuritis*, pleurisis, dolor lateris, inflammatio pleuræ. Eng. *Pleurisy*, pain in the side, side-ache, inflammation on the chest. Ger. Seitenwehe, seitenstechen, seitenstich, entzündung des rippenfells, brustfellentzündung. Dut. Zydewee, pleuris, steeking in de zyde. Dan. Pleuritis, hold og sting, side-sting. Swed. Häll och sting. Fr. Pleurésie, point de côté. Ital. Mal di punta, pleurite, pleurisia, doglia di costa, punta. Span. Pleuritis, pleuresia, dolor de costado, punta de costado.

PLICA POLONICA.

DERIV. *Plica Polonica*, literally the *Polish plait* or *fold*, the national adjective conjoined with the unclassical Latin word *plica*, from *plico*, to twist or fold, perhaps a contraction of the classical word *plicatura*, signifying the same.

PNEUMONIA, PERIPNEUMONIA, PNEUMONITIS.

DERIV. Gr. πνευμονία and περιπνευμονία, from πνευμων, gen. πνευμονος, the lung, φρῆν πνευμα, the breath, from πνέω, to breathe. Πνευμονία and περιπνευμονία are synonymous, although the etymology of the latter word would seem to imply either a more intense degree of the disease, or else a more superficial affection.

NOS. SYN. Πνευμονία : Aret. Περιπνευμονία, Περιπνευμονική νόσος : Dioscor. Vehemens morbus περιπνευμονία : Cels. Pneumonia : Cull. Crich. Parr. Peripneumonia : Coel. Aurel. Sauv. Linn. Vog. Sag. Boerh. Junck. Cull. Darw. Pin. Febris pneumonia : Hoffm. Macb. Pulmonia, Pulmonaria : Auct. Pneumo-pleuritis : Dolæus. Cauma peripneumonia : Young. Empresma pneumonitis : Good. Peripneumonitis : Bourgard. Pneumonitis : Bourgard, Swed. Peripneumonia superficialis : Darw.

VERN. SYN. Gr. Πνευμονία, περιπνευμονία, πνευμονία, περιπνευμονία, πνευμονις. Lat. Peripneumonia, inflammatio pulmonum. Eng. Inflammation of the lungs, peripneumony. Ger. PNEUMOTHORAX.

DERIV. A nosological compound, framed by Itard, from *πνευμα*, air, and *θώραξ*, the chest—*air in the chest*. The construction of the term *pneumothorax* has been criticised as not being in accordance with the more common mode of formation of Greek compounds. It is alledged that the dative, and not the nominative, of the first term is properly employed, and consequently that the word should have been *pneumatothorax*. In making this objection, it seems to be overlooked that the Greeks themselves in their best days frequently used the nominative in place of the dative in compounding words. This is abundantly obvious from many of our most ancient compound medical names, as *hydrothorax*, *hæmoptysis*, and the other compounds of *αίμα* and *ὄψορ*. (See note by *Laennec*, De l'Auscult. Méd. 2nd ed. t. ii. p. 240; and note by *Dr. Houghton*, Cyc. of Pract. Med. vol. iii. p. 451.)

It must, however, be admitted that, as we had previously many terms relating to the *lungs* commencing with *pneumo*, and several relating to *air* commencing with *pneumato*, it might have been better for the sake of uniformity to have employed the term *pneumato-thorax*.

1803 *Itard, E. M.* Dissertation sur le pneumothorax. *Par.* 8vo.

POMPHOLYX. See SKIN, DISEASES OF.

PORRIGO.

DERIV. Lat. *porrigo*, gen. *porriginis*, by some supposed to be derived from *porrum*, a leek, by others from the verb *porrigo*, to spread: neither seems very probable.

NOS. SYN. *Αχρη*: Græc. *Favus*: Lat. *Por-rigo*: Cels. Plin. Vog. Willan. Batem. *Tinea*: Sauv. Sennert. Astruc, Cull. Sag. *Phlysis por-rigo*: Young. *Ecpyesis porrigo*: Good. *Scabies capitis*: Plenck. *Pityriasis*: Swed. *Crusta lactea*, *Impetigo*: Auct.

VERN. SYN.* *Gr.* *Αχρη*. Lat. *Porrigo*, *favus*. *Eng.* Tetter, scall, scalled head. *Ger.* Kleien, kleingrind. *Dut.* Hoofdchilfers. *Dan.* Aspe. *Swed.* Kliskorf. *Fr.* Gourme. *Ital.* Forfore. *Span.* Carpa.

(For Literature, see SKIN, DISEASES OF.)

PREGNANCY (*Med. Jurisp.*) see MEDICAL JURISPRUDENCE.

PROGNOSIS.

DERIV. *Gr.* *προγνωσις*, prescience, fore-knowledge, prognostication, from *προ*, before, and *γνωω*, *γινωσκω*, to know.

VERN. SYN. *Gr.* *Προγνωσις*, *προρρησις*. Lat. *Pro-gnosia* (Isid.), *prænotio*, *præscientia*, *præscitio*, *præsagium*, *prædictio*, *præsensio*, *divinatio*, *præ-sagatio*, *prædictio*. *Eng.* Prognosis, prognostic, prognostication. *Ger.* Vorbedeutung, anziehung, vorhersagung. *Dut.* Voorkenning, voorzegging. *Fr.* Prognostique, pronostique. *Ital.* Pronostico, *præsagium*, *prognosi*. *Span.* Pronostico, pronosticacion.

PROGNOSIS AND CRISIS.

RICKETS—RHACHITIS—RACHITIS.

DERIV. *Rickets.* An original English word of unknown derivation. May it not possibly be derived from the Dutch *ruggegraat*, or the German *rickgrath*, the spine, from this part being that which is most conspicuously affected by the disease? A very slight modification of the pronunciation of either of these words would produce the English word; but it is an obvious objection to this origin that the word is naturalized in England and neither in Holland nor Germany. Dr. Good thinks it probably derived from the verb *rucken*, to rock, reel.

Rhachitis is a nosological term introduced by Glisson, and derived from *ραχις*, the spine, or rather *ραχιδος*, spinal, or dorsal, quasi *ραχιδος νοσος*. *Rachitis* is merely a variety of spelling of Glisson's term.

NOS. SYN. *Tabes pituitosa*: De Bart. *Rhachitis*: Glisson, Ploucq. *Rachitis*: Sauv. Linn. Vog. Sag. Boerh. Hoffm. Cull. *Innutritio ossium*: Darw. *Scrofula rhachitis*: Young. *Cyrtosis rhachia*: Good. *Osteomalacia*: Swed. *Morbus Anglicus*, *Mollities ossium*, *Osteomalacia*, *Ostèosarcosis*: Auct.

VERN. SYN. *Eng.* Rickets. *Ger.* Englische krankheit, doppelte glieder. *Dut.* Engelsche ziekte, lende-ang, dubbele leden. *Dan.* Engelsk syge, dobbelte leder. *Swed.* Engelska sjuka, ledsjsuka, ledknytning. *Fr.* Rachite, chartre, noueure, nouage, rigquets, rachitisme, courbure des os. *Ital.* Rachitide. *Span.* Raquitis, atadura.

ROSEOLA.

DERIV. This term, which has been at different times applied to various diseases, as scarlatina, measles, and purpura, is no doubt derived from *rosa*, a rose, on account of its colour. As *rossalia*, however, is one of its Italian synonyms, it is possible that its immediate descent may be from *rosso*, *rossa*, red.

NOS. SYN. *Roseola*: Severin. Willan, Batem. *Rubeola*: Frank. *Exanthisma roseola*: Young. *Exanthesis roseola*: Good. *Rossalia*, *Rossania*, *Purpura*, *Scarlatina*: Auct.

VERN. SYN. *Eng.* Red-rash, rose-rash. *Ger.* Rothlen, wiebelsucht, wiehlen, ritteln feurma- sern, rother hund. *Pol.* Kur. *Dut.* Roodvonk. *Fr.* Eruption rosacée, rougeole. *Ital.* *Rossalia*, *rossania*.

(For Literature, see SKIN, DISEASES OF.)

RUBEOLA. See MEASLES.

RUPIA.

DERIV. From *ρῦπος*, sordes or filth, from the ill smell and sordid condition of the diseased parts. *Bateman*.

NOS. SYN. *Rupia*: Batem. *Ecpchylis rhyppia*: Good.

(For Literature, see SKIN, DISEASES OF.)

RUPTURE OF THE HEART.

(See HEART, DISEASES OF.)

SCABIES—PSORA—ITCH.

DERIV. *Scabies*. Lat. *scabies*, from *scabo*, to scratch.

Psora. Gr. *ψωρα*, from *ψω*, to rub, to scratch.

Itch. An original English word: *zicha*, Sax.

NOS. SYN. *Ψωρα*: Auct. Græc. *Scabies*: Cels.

Sauv. Vog. Sag. Willan, Batem. *Psora*: Linn.

Cull. Darw. Swed. *Phlysis scabies*: Young.

Ecpyesis scabies: Good.

VERN. SYN. Gr. *Ψωρα*, *κνισμωσις*. Lat. *Scabies*, *scabiola*, *scabitudo*. Eng. *Itch*. Scot. The scab, the yuck. Ger. Krätze, jucken der haut, raude, kratzausschlag. Pol. Swierz. Dut. Schurft, krauwagie, krauwzel. Dan. Skab, kløe, fnat. Swed. Skabb, kläda. Fr. Gale, rogne, gratelle, charpin. Ital. Scabbia, rognia, raspa, raschia. Span. Sarna, roña.

(For Literature, see SKIN, DISEASES OF.)

SCARLATINA.

DERIV. Ital. *scarlatina* or *scarlattina*, from *scarlattino*, the colour scarlet, also scarlet cloth.

NOS. SYN. *Febris miliaris rubra*: Huxh. *Scarlatina*: Sauv. Vog. Sag. Junck. Cull. Frank. Swed. *Scarlatina febris*: Sydenh. *Febris scarlatinosa*: Wilh. *Scarlatæ*: Vog. *Rossalia*: Ingrass. Hoffm. *Purpura*: Junck. Schulz. *Morbilli confluentes*, *Rubeola confluens*: Auct. *Purpura scarlatina*: Burser. *Porphyrisma*: Ploucq. *Exanthesis rosalia*: Good. *Febris rubra*: Heberd. *Typhus scarlatinus*: Cricht. *Typhus scarlatina*: Young. *Febris scarlatino-miliaris anginosa*: Brunning.

VERN. SYN. Eng. Scarlet fever, scarlatina. Ger. Scharlachfieber, scharlachaufschlag, scharlachkrankheit. Pol. Szkarlat. Dut. Purpurkoorts, scharlaakekoorts. Dan. Skarlagensfeber, norisle, narisle, narild. Swed. Skarlakansfeber, halsjsjuka. Fr. Fièvre pourprée, fièvre rouge, scarlatine. Ital. Scarlattina, rossalia, rossania, febbre rossa. Span. Escarlatina, escarlata, mal colorado, alfrombilla.

SCIRRHIUS, CANCER, CARCINOMA.

DERIV. *Scirrhus*. Gr. σκίρρος, a hard tumour, primitively a chip or small fragment of marble.

Cancer. Lat. *cancer*, a crab, (Gr. καρκίνος), metonymically applied to the disease from the claw-like spreading of the veins.

Carcinoma. Gr. καρκινώμα, a cancerous tumour, also having the same original meaning as καρκίνος and *cancer*.

Nos. SYN. Σκίρρος, Σκίρρος; Gal. Καρκίνος; Hipp. Gal. Καρκινώμα; Dioscor. *Scirrhus*, *Scirrhomia*; Plin. *Cancer*, *Carcinoma*; Cels. *Scirrhus*; Sauv. Linn. Vog. Sag. Boerh. Cull. *Cancer*; Sauv. Vog. Boerh. Sag. Cull. *Carcinoma*; Sauv. Linn. Vog. Sag. Young. *Carcinus*; Good. *Cancer*; Macb. Cull. Parr. *Skirrhus*, *Carkinoma*; Swed.

VERN. SYN. Gr. Σκίρρος, σκίρρος, σκίρρωμα, σκίρρωμα, καρκίνος, καρκινώμα. Lat. *Sciros*, *scirrhus*, *sciroma*, *scirrhomia*, *cancer*, *carcinoma*, *carcinosis*. Eng. *Scirrhus*, *cancer*. Ger. *Krebs*, *krebsschaden*, *skirrus*, *krebssgeschwür*. Dut. *Kanker*, *kreeftgezwel*, *kankergezweel*. Dan. *Kræft*, *krebs*. Swed. *Skirre*, *kräfta*, *kräftskada*. Fr. *Cancer*, *scirrhe*, *carcinome*. Ital. *Scirro*, *cancro*. Span. *Scirro*, *sirro*, *cancer*, *carcinoma*, *cancro*.

SCORBUTUS—SCURVY.

DERIV. There is considerable difference of opinion as to the origin of the word *scorbutus*, but it seems at least certain that it is only a Latinized variation of the vernacular name of the disease among northern nations, whether *scorb*, *schorbuk*, *scharbock*, or *skorbut*. The English term, anciently *scorbie*, is obviously another branch of the same stock.

NOS. SYN. *Scorbutus*: Sauv. Linn. Vog. Sag. Boerh. Hoffm. Junck. Cull. Swed. *Scorbutus nauticus*: Young. *Porphyra nautica*: Good. *Morbus polyrizos et polymorphos*: Maynwaring (Swed.)

VERN. SYN. Eng. Scurvy. Ger. Scharbock, skorbut. Dut. Scheurbuik, blaaweschuit, schimmelziekte, blaawzugt. Dan. Skörbug, skiorbug. Swed. Skörbjug, gastkramod. Fr. Scorbut. Ital. Scorbuto. Span. Escorbuto, berben, mal de Loanda.

SCROFULA—SCROPHULA—STRUMA.

DERIV. We find the word *scrofula*, or rather *scrofulæ* in the plural, employed for the first time to signify the present disease, or one supposed analogous to it in cattle, by Vegetius in his work *De Re Veterinaria*.* It is generally admitted to be derived from the Latin *scrofa*, (also written *scrophu*,) a sow, although the reason of the derivation is by no means clear. The same analogy, whatever it may have been, influenced the Greek writers (and doubtless the Romans borrowed it from them) in naming the disease, as their term for *scrofula*, *χοιρας*, is a mere diminutive of *χοιρος*, a sow.† *Struma* is the classical Latin name of the disease, and is synonymous with *χοιρας*: its derivation is unknown.

Nos. SYN. *χοιρας*, *χοιραδες*: Hipp. *Struma*: Cels. Plin. Linn. Good. *Scrophula*: Sauv. Vog. Sag. Cull. Mach. Darw. Young. *Scrophulæ*: Pinel. *Choiras*: Swed.

VERN. SYN. Gr. *χοιρας*, *χοιραδες*. Lat. *Struma*, *scrofulæ*. Eng. *Scrofula*, the king's evil, the evil. Scot. The cruels. Ger. Kropf, skropheln, skrofelkrankheit. Dut. Klieren, kropzweeren, kliergezwellen. Dan. Skrofer, kiertelknuder.

* "Plerumque strumæ, vel parotides, aut scrofulæ jumentorum guttur infestant." lib. ii. cap. 23.

† Might I hazard the following conjecture as at least not more improbable than some that have been proposed, as to the reason of the application of the terms *χοιρας* and *scrofula*, i. e. a little pig, to the strumous disease? viz. that the smooth, rounded, conglomerated swellings of the sub-maxillary glands (to which the term was at first restricted) suggested the name from their fanciful resemblance to a litter of young pigs lying huddled together, or even from the form of a single swelling, bearing some resemblance in its rounded outline to the animal? This notion may seem to derive greater plausibility from the fact that the Greeks actually gave the same name of a young pig (*χοιρας*) to small rocks just rising above the surface of the sea, from their fancied resemblance to the back of a pig when swimming; and it may not be altogether irrelevant to add, that the swelling produced by a blow upon the face or head is vulgarly termed a *mouse*.

- Swed.* Körtelvulster, krofer, krittlar. *Switz.* Scrovole. *Fr.* Ecrouelles, glandes. *Ital.* Scrofula, scrofole, scrofe. *Span.* Lamparones, escrofulas.

SIVVENS, OR SIBBENS.

DERIV. This term, which is the Scotch word for the wild raspberry, is applied to the disease precisely as the French word, *framboise*, has been applied to the disease termed yaws, from supposed similarity of appearance.

NOS. SYN. *Thymiosis* (from *θυμιον*, a fungous wart), *Lepra Norwegica*: Swed.? *Exanthema arcticum*: Voug? *Syphilis, Syphiloides*: Good. *Syphilis Scotica*: Young.

VERN. SYN. *Ital.* Mal di Scherlievo, mal di Fiume? *Norw.* Radesyge? *Ger.* Nordische aussatz? *Fr.* Scerlievo. *Erse*, Soucruu.

1765 *Gilchrist, Eb. M.D.* Account of a very infectious distemper (*sibbens*) (Essays Phys. and Lit. iii)

SMALL-POX—VARIOLA.

DERIV. The source of the term *variola* is still conjectural. Dr. Good is of opinion that the Latinised word is derived from the Spanish, either from "an old Spanish word *vario*, a *pock* or *pimple*," or from the present vernacular Spanish name for the disease, *viruelas*, which he derives from the Latin *virus*. It seems, however, much more likely that the Spanish name was derived from the modern Latin one, *variola*, whatever may have been the source of this,—whether *varius*, variegated or party-coloured, or *varus*, a spot or pimple, as is differently conjectured.

The origin of the term *pox*, originally *pocks*, and of *small-pox*, is evident from the very word, *pock*, or *poc*, signifying in the ancient Saxon, as in its modern branches, a *bag* or *pouch*. The prefix *small* was not added until the introduction of the

great-pox (syphilis) into Europe. Indeed in secluded parts of the country, where syphilis is unknown, as in some of the rural districts of Scotland, the variolous disease is still known among the peasantry by the term of *the pocks* or *pox*, exclusively.

NOS. SYN. *Euphlogia*: Rhazes. *Variolæ*: Boerh. Junck. Sydenh. *Variola*: Sauv. Linn. Sag. Cull. Swed. *Febris variolosa*: Hoffm. Vog. *Synochus variola*: Young. *Empyesis variola*: Good. *Synochus variolosus*: Cricht.

SOFTENING (OF ORGANS).

The derivation of this term is self-evident. I introduce it with the view of deprecating the employment of the French synonym *ramollissement*, when our vernacular name is at once equally expressive, and certainly more euphonous and convenient.

SOMNAMBULISM.

DERIV. From *somnus*, sleep, and *ambulo*, to walk, *sleep-walking*. The state is also called, though less appropriately, *noctambulism*, from *nox*, night, and *ambulo*. The subject or patient is called in the modern Latin *somnambulus* or *noctambulus*.

NOS. SYN. *Somnambulismus*: Sauv. Linn. Sag. *Noctambulatio*: Junck. *Paroniria ambulans*: Good. *Oneirodynia activa*: Cull. *Hypnobotasis* (ὑπνοβασις): Vog. *Erethismus oneirodynia*: Young. *Rhembasmus* (ρεμβασμος): Swed. *Nyctobasis* (νυκτοβασίς), *Noctisurgium*, *Catalepsis delirans*: Auct.

VERN. SYN. Eng. Sleep-walking, somnambulism. Ger. Schlaf-spazieren, nacht wandeln. Dut. Nagtwandeling. Dan. Søvngængen, natgaengen. Swed. Sömnvandrang, nattgång. Fr. Somnambulisme. Ital. Somnambulismo. Span. Somnambulismo.

(For Literature, see NERVOUS DISEASES)

SPINE AND SPINAL MARROW,
DISEASES OF.

SYN. (1. Spine) Gr. *σπίναξ*. Lat. Spina, spina dorsi. Lat. rec. Columna vertebralis. Eng. The spine, the chine, the backbone, the vertebral column. Ger. Rückgrat, rückgrath. Fr. Rachis, colonne vertébrale. Ital. Spina, colonna spinale, colonna vertebrale.

(2. Spinal marrow) Gr. *σπίνας μυελος*. Lat. Medulla spinalis. Eng. Spinal marrow. Ger. Rückenmark. Fr. Moelle de l'épine, moelle épinière. Ital. Spinale midallo.

1778 Pott, Perc. Remarks on palsy of the lower limbs, &c. Lond. 8vo.

SPLEEN, DISEASES OF.

DERIV. GR. *σπλην*, gen. *σπληνος*, the spleen.

VERN. SYN. *Lat.* Lien, splen. *Eng.* Spleen, milt. *Scot.* Melt. *Ger.* Milz. *Dut.* Dan. Milt. *Swed.* Mjält. *Fr.* Rate. *Ital.* Milza. *Span.* Bazo.

GR. *σπληνεις* (plur.), diseased spleen : Hipp. *Lat.* *Lienes* (plur.), diseased spleen.

Splenalgia—*Splenis tumor*.

DERIV. From *σπλην*, spleen, and *αλγειν*, to be painful.

NOS. SYN. *Dolor lateris, Obstructio lienis*: Sennert. *Splenalgia*: Sauv. Sag. Swed. *Splenica*: Linn. *Physconia splenica*: Sauv. Cull. Parr. *Parabysma splenicum*: Good. *Splenis tumor*: Darw. *Splenoncus*: Swed. *Emphraxis splenis*: Swed. *Obstructio lienis, Scirrhus lienis*: Auct.

VERN. SYN. GR. *Σμικρος σπληνος, οιδημα σπληνος*. *Lat.* Splenis dolor, lienis tumor. *Eng.* Pain in the side, pain in the spleen, ague-cake. *Ger.* Milzweh, schmerzender milz. *Dut.* Miltziekte. *Dan.* Miltsyge, miltstot. *Swed.* Mjältsjuka. *Fr.* Douleur de la rate, mal de rate. *Ital.* Dolore di milza, ostruzione di milza. *Span.* Dolores de bazo.

Splenitis.

DERIV. From *σπλην*, spleen, with the addition of the terminal sign of inflammation, *itis*. There is a classical Greek word *σπληνιτις*, but it is an adjective, signifying *splenal*, or relating to the spleen.

NOS. SYN. *Splenitis*: Plater, Sauv. Linn. Vog. Junck. Sag. Macb. Cull. Swed. *Lienis inflammatio*: Boerh. Sennert. *Splenalgia suppuratoria*: Sauv. *Cuxma splenitis*: Young. *Empresma splenitis*: Good. *Lienitis*: Auct.

VERN. SYN. *Lat.* Inflammatio lienis. *Eng.* Inflammation of the spleen. *Ger.* Entzündung der milz, milzentzündung. *Dut.* Miltonsteeking. *Fr.* Inflammation de la rate. *Ital.* Infiammazione di milza. *Span.* Inflamación de bazo, esplenitis.

(See HEART, DISEASES OF.)

SYPHILIS—LUES VENEREA— VENEREAL DISEASE.

DERIV. The real origin of this term is unknown, although we find numerous conjectures and theories propounded by etymological writers respecting it. Swediaur has, very clumsily, I think, imagined it to be derived from *σὺς*, a swine, and *φιλεῖν*, to love, *quasi*, the fruit of a swinish or impure congress;—others from *συν*, with, and *φιλία*, love, simply, an attendant on venereal gratification; others, again, have traced it from *σιφλος*, *disfigured*, more particularly in the face, and certainly with more probability; while a still more numerous class have adopted the classical legend of Fracastorius, and derive the name directly from a certain shepherd of king Alcithous, *Syphilis* by name, who was made the first victim of this disease as a punishment for certain sacrilegious acts of his against Sol or Apollo—

“—— à primo traxit cognomina morbus
Syphilidemque ab eo labem dixere coloni.”*

The origin of the phrases, *lues Venerea*, the venereal infliction, *morbus Venereus*, the venereal disease, *morbus Gallicus*, the French disease, &c. is sufficiently manifest.

Nos. SYN. *Syphilis*: Sauv. Linn. Vog. Sag. Cull. Darw. Pinel, Parr, Young, Swed. *Lues venerea*: Fernel. Boerh. Hoffm. Junck. Astruc. Macb. Cricht. *Syphilis venerea*: Sauv. *Scabies venerea*: Locher. *Lues syphilis*: Good. *Lues syphilitica*, *Morbus Neapolitanus*, *Morbus Gallicus*, *Morbus venereus*: Auct.

VERN. SYN. Eng. Pox, venereal disease, bad disorder, foul disease, French disease. Ger. Lustseuche, venerische krankheit, Franzosen. Dut. Venus ziekte, Spaanse pokken. Sued. Fransoser, Franska koppor. Dan. Lystsyge, Fransoser, klepholdt. Fr. Vérole, vérole commune, grande vérole; maladie vénérienne, mal de Naples. Ital. Mal Francese, lue venerea. Span. Bubas, Gallico, mal venereo.

TETANUS.

DERIV. **Gr.** *τετανος*, literally *stretched, strained*, or *stiff*, but used substantively as the name of the disease, from *τιταίνω* or *τεινω*, to stretch. It has obtained particular appellations according to the particular manner in which the body is bent—viz.

Emprosthotonos. **Gr.** *εμπροσθοτονος*, or *εμπροσθοτονια*, when the body is bent forwards, from *εμπροσθεν*, forwards, and *τεινω*, to stretch.

Opisthotonos. **Gr.** *οπισθοτονος* or *οπισθοτονια*, when the body is bent backwards, from *οπισθεν*, backwards, and *τεινω*.

Pleursthotonos, from *πλευροθεν*, side-wards, and *τεινω*, when the body is bent laterally.

Trismus. **Gr.** *τρισμας*, literally gnashing of the teeth, when the flexor muscles of the jaws are chiefly affected, from *τριζω*, to grind the teeth.

Nos. SYN. *Τετανος*: Auct. **Græc.** *Cels.* *Τετανος σπασμοι*: Aret. *Tetanus*, *Opisthotonus*: Plin. *Tetanus*: Sauv. Linn. Vog. Sag. Macb. Cull. Swed. *Opisthotonos*, *Episthotonos*: Vog. *Tris-*

mus: Sauv. Linn. Sag. Cull. *Pleurosthotonus*: Strack. *Tonos trismus*: Parr. *Capistrum*: Vog. *Entonia rigida*: Young. *Entasia trismus*, *Entasia tetanus*: Good. *Catochus*: Auct.

VERN. SYN. Gr. Τίτανος, τίτανοι σπασμοί. Lat. Tetanus. Eng. Tetanus, locked-jaw, tetany. Ger. Todtenkrampf, starrkrampf, tetanos, halsstarre. Dut. Kramptrekking, spanning, halsstijfte, doodstuipen. Dan. Dødningkrampe. Swed. Kjust. Fr. Tétanos, tetanus. Ital. Tetano. Span. Tetano, envoramiento.

THROAT, DISEASES OF—PHARYNGITIS—

CYNANCHE PHARYNGEA; — ISTHMITIS — PARISTHMITIS; — TONSILLITIS — CYNANCHE TONSILLARIS—ANTIADITIS.

DERIV. *Pharyngitis*. Gr. φαρυγξ, gen. φαρυγγος, pharynx, the interior and lower part of the throat, and the particle *itis*.

Cynanche pharyngæa. For the derivation of cynanche, see the word in letter C.—*Pharyngæa*, adj. relating to the pharynx.

Isthmitis. Gr. ισθμος, the throat, and the particle *itis*: inflammation of the throat.

Paristhmitis. Gr. παρα, about, ισθμος, and the particle *itis*: inflammation about the throat.

Tonsillitis. From Lat. *tonsillæ*, the tonsils, with the terminal particle *itis*—"denominatio damnan-da," as Kühn says, since it presents a Latin word with a Greek termination.

Cynanche tonsillaris. Gr. subst. κυναγχη, and Latin adj. *tonsillaris*. This combination is liable to the same objection as tonsillitis.

Antiaditis. Gr. αντιας, gen. -αδος, plur. αντιαδες, the tonsils, and the terminal particle *itis*. This is a word formed on better principles, but at present it is very little used.

NOS. SYN. Παρισθμία: Hipp. Gal. Παρασυναγχη, Κυναγχη, Συναγχη: Auct. Græc. *Tonsillarum inflammatio*: Cels. *Prunella*: Paracels. *Angina*: Cels. Vog. Hoffm. Juncq. *Cynanche*: Linn. Sag. Sauv. *Cynanche pharyngæa*, *Cynanche tonsillaris*: Sauv. Cull. *Angina inflammatoria*, *Dysphagia inflammatoria*: Boerh. *Isthmitis*: Ploucq. Swed. *Cynanche faucium*: Parr. *Antiaditis*, *Antiadoncus*

phlogisticus: Swed. *Cauma paristhmitis*: Young. *Empresma paristhmitis*: Good. *Angina tonsillaris*: Auct. *Pharyngitis*: Auct. Rec.

VERN. SYN. Gr. *Παρίσθμις, κυναγχή, συναγχή*. Lat. Angina. Eng. Sore throat, quinsy, squinsy. Ger. Kehlucht, halsentzündung, halsweh, bräune. Dut. Keelontsteeking, kwaade keel, worg, bruine. Dan. Halsbættendelse, halspine, halsvee, halsbrynde. Swed. Halssjuka, halstäppa, halsbrand. Fr. Mal de gorge, esquinancie, angine. Ital. Angina, mal di gola, schienanzia. Span. Mal de garganta, garotillo, esquinencia.

(For Literature, see CYNANCHE.)

TONGUE, DISEASES OF.

VERN. SYN. (Tongue.) Gr. *γλῶσσα, γλωττα*. Lat. Lingua. Eng. Tongue. Ger. Zunge. Dut. Tonge. Fr. Langue. Ital. Lingua. Span. Lengua.

1834 *Blandin*, Dict. de Méd. Prat. (art. *Langue*) t. xi. *Par.* 8vo.

(See GLOSSITIS.)

TOXICOLOGY—POISONING.

DERIV. From *τοξικον*, a poison (plur. *τοξικα*), and *λογος*, a discourse. *Τοξικον* itself is commonly derived from *τοξον*, a bow,—either, as Dioscorides says, because barbarians were accustomed to anoint their arrows with poison; or, as others think, because poison destroys life as rapidly and certainly as an arrow from the bow; or, lastly, because Hercules dipped his arrows in the (poisonous) blood of the hydra. Some, however, are of opinion—and I own this to me seems the most probable conjecture—that the word *τοξικον* is the name of a poisonous plant, growing in Syria or Africa. (See Castelli Lexicon, in voce.)

URINE, (CHIEFLY AS A SIGN.)

DERIV. The English word is probably derived immediately from the French, but ultimately, of course, from the Latin, and that as clearly from the Greek.

VERN. SYN. Gr. Ουρον, ουρημα. Lat. Urina, lotium. Eng. Urine, water, (piss). Ger. Harn, urin, wasser. Dut. Dan Swed. Pis. Fr. Urine, eau. Ital. Orina. Span. Orina, orin.

1474 *Gordon, B. de.* Liber de urinis. *Lion.* 8vo.

1494 *Ægidius,* Carmina de urinis et pulsibus. *Venet.* 4to.

1495 *Ketam, J. de.* Fasciculus medicinæ de judiciis urinarum. *Venet.* fol.

VARICELLA—CHICKEN-POX.

DERIV. Dr. Good says varicella is of Spanish origin, being altered from *varizella*, the diminutive, he says, of *variz*, a cutaneous tumour. It must be acknowledged, however, that this derivation is not very satisfactory. It would seem as likely to be the *Italian* diminutive of *vario* or *variola*. (See *Small-Pox*.)

Nos. SYN. *Chrystalli*: Vid. Vid. *Varicella*: Cull. Plenck, Heberd. Batem. Swed. *Variola pusilla*: Heberd. *Variola benigna*: Morton. *Variola lymphatica*: Sauv. *Pemphigus variolodes vesicularis*: Frank. *Exanthema varicella*: Parr. *Sy. ochus varicella*: Young. *Emphlysis varicella*:

* Only a few of the immense number of publications on cow-pox have been selected.

Good. *Hydrachnis*: Cusson. *Variolæ spuria*, *Variolæ lymphatica*, *Variolæ volatica*: Auct.

VERN. SYN. Eng. Chicken-pox, swine-pox, water-pox. Ger. Unachten kindspocken, falsche pocken, fliegenden pocken, windpocken, hünerspocken, schafpocken. Dut. Windpokken. Dan. Skoldekopper. Swed. Väderkopper. Fr. Vérole, vérole volante, verette. Ital. Ravaglione, rovgaglioni, varicella, morviglioni, vajuolo selvatico. Span. Viruelas locas.

(For Literature, see SKIN, DISEASES OF.)

VIGILIA—AGRYPNIA— WAKEFULNESS.

DERIV. *Vigilia*. Lat. *vigilia*, wakefulness, or rather watching, from *vigilo*.

Agrypnia. Gr. ἀγρυπνία, the same sense; by pleonasm used for αὐπνία; from α, priv. and πνις, sleep.

NOS. SYN. *Agrypnia*, *Αὐπνία*: Auct. Græc. *Vigilia*: Cels. *Agrypnia*: Sauv. Linn. Vog. Sag. Good, Swed. *Erethismus agrypnia*: Young. *Pervigilium*: Boerh. *Vigiliæ inmodicæ*, *Vigilium morbosum*: Auct.

VERN. SYN. Gr. ἀγρυπνία. Lat. *Vigilia*, insomnia, insomnietas, pervigilium, pervigilia. Eng. Wakefulness, sleeplessness. Ger. Schlaflosigkeit. Dut. Slaapeloosheid, waaken, waking. Dan. Sövnløshed. Swed. Sömlöshet. Fr. Insomnie, veille. Ital. Vegghia. Span. Vigilia, desvelo.

VOMICA.

DERIV. Lat. *vomica*, an abscess, commonly supposed to be derived from *vomo*, because it vomits or pours out its fluid contents. Triller, however, thinks that it is more probably derived from the Greek word *φύμα*, which is synonymous with the Latin *vomica*, by the formation, first, of an adjective *φύμικος*, *φύμικη*, and then taking this substantively, *φύμικη*, from which, he says, "sponte nascitur *vomica*." This is all very doubtful. Formerly the term *vomica* was applied to any internal or visceral abscess, it being only of late years that it has been restricted to abscess in the lungs.

NOS. SYN. *Vomica*: Cels. Linn. Vog. Cull. Boerh. Junck. *Apostema vomica*: Sauv. Good.

VERN. SYN. Eng. Imposthume in the lungs, abscess in the lungs. Ger. Lungengeschwür, eitersack. Dut. Longezweer, etterzak, etterbuil. Dan. Lungebyld. Swed. Lungböld, etterböld, varsäck. Fr. Vomique, abcès dans le poutmon. Ital. Vomica. Span. Vomica.

(See LUNGS, DISEASES OF, and PHTHISIS PULMONALIS.)

VOMITING.

DERIV. Lat. *vomit*, *vomitio*, *vomitum*, vomiting, from *vomito*, to keep vomiting, from *vomo*, to vomit.

NOS. SYN. Εμέσια: Hipp. *Vomit*: Cels. Sauv. Linn. Vog. Sag. *Palmus vomitus*: Young. *Emesis vomitus*: Good. *Hyperemesia*: Swed.

VERN. SYN. Gr. Εμέσις, εμέσια. Lat. *Vomit*, *vomitio*, *vomitum*. Eng. Vomiting, puking, spewing. Ger. Erbrechen, ubergeben, brechen. Dut. Braaking, spouwing. Dan. Brækning, opkastelse, spyening. Fr. Vomissement. Ital. Vomizione, vomito. Span. Vomit.

(See DYSPESIA, and STOMACH, DISEASES OF.)

WATER.

DERIV. A primitive English word.

VERN. SYN. Gr. ὕδωρ. Lat. *Aqua*. Eng. Water. Ger. Wasser. Dut. Water. Dan. Vatter. Swed. Vatten. Fr. Eau. Ital. Acqua. Span. Agua.

WATERS, MINERAL.

DERIV. The term *mineral*, as applied to waters, is derived from the unclassical Latin adjective *mineralis*, signifying *metallic*, and this from the equally barbarous word *minera*, a *metallic vein*.

SYN. Aquæ minerales, aquæ medicatæ, aquæ soteriæ, (Gr. *σωτηριος*, salutaris, *ὑδατα σωτηρια*); Auct. Lat. rec. Ger. Mineralwasser. Dut. Bergwerk-wateren, mineraal-wateren. Fr. Eaux minérales. Ital. Acque minerali. Span. Aguas minerales.

WORMS—VERMES—ENTOZOA— VERMINATION.

DERIV. The English and Dutch *worm* and the Latin *vermis* are probably derived from the same original source. The disease implying the pre-sence of these animals in the human body, is fre-quently indicated by the plural of the vernacular term.

Entozoa, a modern term, is derived from the Gr. εντος, within, and ζωα, plural of ζωον, an animal, quasi inside-animals.

Vermination, Lat. *verminatio*, a breeding of worms, from *vermino*, to breed worms, from *ver-mis*.

Nos. SYN. *Verminatio*: Plin. *Helminthia*: Good. *Parasitismus intestinalis*: Young. *Hel-minthiasis*: Swed.

VERN. SYN. Gr. *Σκωληκωσις*. Lat. *Verminatio*. Eng. Worms, invermination. Ger. Würmer, wurm-sucht. Dut. Wormen. Dan. Orme. Swed. Maskar. Fr. Vers. Ital. Vermi. Span. Gusanos.

YAWS—FRAMBÆSIA.

DERIV. *Yaw*, or *yaws*, is said to be the African name for *raspberry*, and was given to the disease by the natives of Africa from the supposed resemblance of the eruption to the fruit.

Frambesia is a sort of Latinised form of the French word for the same fruit, *framboise*, and was applied to the disease by the French nosologists after translating the name into their own language.

NOS. SYN. *Frambæsia*: Sauv. Sag. Cull. Ploucq. Batem. *Phymatosis frambæsia*: Young. *Anthracia rubula* (from *rubus*, the raspberry): Good. *Lepra fungifera*: Cartheus. *Thymiosis* (θυμωσις, a kind of warty tumour): Swed.

VERN. SYN. *Afric.* *Yaw*, *yaws*, *gattoo*. *Amer.* *Pian*, *epian*. *Eng.* *Yaws*. *Ger.* Schwammformige aussatz, beerschwamm. *Fr.* *Pian*. *Ital.* *Framboasia*. *Span.* *Frambuesa*.

1744 *Hume, John, M.D.* A description of the African distemper called the yaws (Edin. Med. Ess. vol. vi.) *Edin.* 12mo.

1761 *Hillary, W. M.D.* Observations on the diseases of Barbadoes, &c. (on the yaws, p. 339.) 2nd edit. *Lond.* 8vo.

1764 *Grainger, J. M.D.* An essay on West India diseases (of the yaws, p. 55.) *Lond.* 8vo.

(See SKIN, DISEASES OF, and SYPHILIS.)

END OF BIBLIOGRAPHY.

November 1st, 1835.

VALUABLE
MEDICAL BOOKS,

Published by

SHERWOOD, GILBERT, AND PIPER,

PATERNOSTER-ROW, LONDON.

Dr. James Clark on Consumption.

TREATISE on PULMONARY CONSUMPTION, comprehending an Inquiry into the Nature, Causes, Prevention, and Treatment of TUBERCULOUS and SCROFULOUS DISEASES IN GENERAL. By JAMES CLARK, M.D. F.R.S. 8vo. price 12s.

"Dr. Clark's treatise on Consumption is the best that has yet been published in this country, or on the Continent; it shows an intimate knowledge of the improved methods of diagnosis, and of the morbid anatomy so successfully investigated by the Continental pathologists, and by Professor Carswell; while it displays an acquaintance with the resources of the system, and the power of therapeutic agents, only possessed in this country and in Germany."—*Lancet*, Aug. 1835.

"We recommend strongly the study of the author's hygienic remarks to our professional brethren; indeed, we think that every parent ought to be acquainted with the excellent rules laid down on NURSING, DRESS, BATHING, AIR, EXERCISE, and EDUCATION. We have seldom seen a medical work more deserving of general circulation, or one that we would more zealously recommend to the younger members of the profession."—*Medical Quarterly Review*, April, 1835.

Dr. Prichard on Insanity.

TREATISE on INSANITY, and other DISORDERS affecting the MIND; accompanied with numerous Cases, exemplifying various Descriptions of Madness. By J. C. PRICHARD, M.D., F.R.S. Corresponding Member of the Institute of France; Member of the Royal Academy of Medicine of Paris, and of the Philosophical Society of Sienna; and Senior Physician of the Bristol Infirmary. Handsomely printed in Octavo, price 14s. in cloth.

"Dr. Prichard's work shows an extensive knowledge of his subject. The materials have been industriously collected in our own and in foreign asylums,—in the British, but more particularly in the French and German writers on Insanity. The style is elaborately finished. The work will form an indispensable addition to every medical library; and it may be regarded as an essential index to the literature of the disease."—*Lancet*, Aug. 1835.

"The author is entitled to great respect for his opinions, not only because he is well known as a man of extensive erudition, but also on account of his practical acquaintance with the subject on which he writes. The work, we may safely say, is the best, as well as the latest, on mental derangement, in the English language."—*Medico-Chirurgical Journal*, July, 1835.

"It is the most elaborate, comprehensive, and useful treatise on Insanity, that has yet appeared in this country."—*Medical Quarterly Review*, April 1835.

Hoblyn's Medical Dictionary.

DICTIONARY of TERMS used in MEDICINE and the COLLATERAL SCIENCES; a MANUAL, for the USE of STUDENTS and the SCIENTIFIC READER: containing the ETYMOLOGY and MEANING, NOMENCLATURES, CLASSIFICATIONS of NOSOLOGY, MATERIA MEDICA, POISONS and their ANTIDOTES, ANALYSES of MINERAL WATERS, an ACCOUNT of CLIMATES, &c.; Tabular Sketches of CHEMISTRY, MEDICAL BOTANY, and ZOOLOGY. By RICHARD D. HOBLYN, A.M. late of Balliol College, Oxford. Price 9s.

"A work much wanted, and very ably executed."—*London Medical Journal*, Sept. 1835.

"This compendious volume is well adapted for the use of Students. It contains a complete Glossary of the terms used in Medicine,—not only those in common use, but also the more recent and less familiar names introduced by modern writers. The introduction of tabular views of different subjects is at once comprehensive and satisfactory. It must not however be supposed that the volume is a mere word-book; it is, on the contrary, an extremely interesting manual, beautifully printed, containing much excellent matter in a little space, and is deserving of our strong recommendation."—*Medical Gazette*, Sept. 1835.

"Concise and ingenious."—*Johnson's Medico Journal*, Oct. 1835.

"It is a very learned, painstaking, complete, and useful work—a Dictionary absolutely necessary in a medical library."—*Spectator*, Nov. 1, 1835.

Boivin and Duges on the Uterus, by Dr. Heming.

PRACTICAL TREATISE on the DISEASES of the UTERUS and its APPENDAGES. Translated from the French of MME. BOIVIN, Sage-Femme Surveillante en Chef de la Maison Royale de Santé, &c., and A. DUGES, Professeur à la Faculté de Médecine Montpellier, &c.: with copious Notes, by G. O. HEMING, M.D. Glasg. F.L.S. Physician Accoucheur to the St. Pancras Infirmary, &c. Elegantly printed in One large Volume, 8vo. 14s. boards.

Also, FORTY-ONE PLATES to illustrate the above, engraved from the originals, as Drawings from Nature, by MDE. BOIVIN. Price 12s.; or accurately coloured, 1*l.* 11s. 6*d.*

"The work of Boivin and Duges, on the Diseases of the Uterus, is indispensable to the library of every practitioner: nothing can exceed in fidelity the description here given of the natural structure of the uterus, and the various morbid changes to which that organ is liable; and Dr. Heming has shewn a sound discrimination in rendering it into English."—*Lancet*.

"The Preface, by Dr. Heming, contains a slight sketch of the recent improvements in this department of medical science, in which the structure of the healthy uterus, and its appendages, is considered in the infantile, virgin, pregnant, and puerperal states.... Many excellent observations are added, both from Dr. Heming's own experience, and from the writings of the best authors of this country, and, whenever he has stated his own opinions, they appear to be sensible and to the purpose. The Plates to the work are of great assistance in understanding the Author's descriptions, and are exceedingly cheap."—*Medical Quarterly Review*, Oct. 1834.

Barnes's Medical Botany.

TABLE, containing the CLASS, ORDER, PLACE of GROWTH, FORM of EXHIBITION, PROPERTY, DOSE, ACTIVE PRINCIPLE, and NAME of SUBSTANCE of the PLANTS used in MEDICINE; for the Use of Students. By JOHN BARNES, Lecturer on Materia Medica. Price 2s. 6*d.* in cloth, for the pocket, or 1s. on a sheet.

"This is a useful pocket compendium, and the facts which it contains are those which young medical botanists most need to fix in their memory, compressed into a small form, and stripped of superfluous matter. This conspectus of Mr. Barnes's is well suited to the object of his labours, which is clearly arranged, neatly printed, and has our recommendation, as a cheap and useful adjunct to the stock of medical books."—*Lancet*, April 1835.

By Dr. Marshall Hall.

PRINCIPLES of DIAGNOSIS, founded on the HISTORY, SYMPTOMS, MORBID ANATOMY, and the EFFECTS of REMEDIES. Second Edition, entirely re-written. By MARSHALL HALL, M.D. F.R.S. L. and E., Lecturer on the Practice of Physic, &c. &c. Complete in One Volume, price 14s. bds.

This work is written as a *guide* in the study of the Practice of Physic.

"The object of it is most important, the execution of it is very able, and I have read it with great advantage."—*M. Baillie*.

COMMENTARIES principally on some DISEASES of FEMALES which are in their Nature and Origin CONSTITUTIONAL. New Edition, with Plates, price 16s.

OBSERVATIONS on the due ADMINISTRATION of BLOOD-LETTING; founded upon Researches principally relative to the MORBID and CURATIVE EFFECTS of the LOSS of BLOOD. 9s.

"We believe the credit of having first put forward in a strong light, the practical utility of attending to these points (blood-letting) is eminently due to Dr. Marshall Hall. * * *

"We may take this opportunity of recommending Dr. Hall's valuable work to our readers; they will find in it several rules and observations of great importance relative to blood-letting, as a diagnostic of diseases."—*Medical Gazette*, Nov. 1835.

CRITICAL and EXPERIMENTAL ESSAYS on the CIRCULATION of the BLOOD; especially as observed in the Minute and Capillary Vessels of the Batrachia and of Fishes. 8vo. with plates. Price 9s.

A Vade-Mecum for Surgeons.

LONDON SURGICAL POCKET-BOOK, (Medical, Operative, and Mechanical); founded on the Popular LECTURES and WORKS of the late Mr. ABERNETHY, Sir ASTLEY COOPER, Mr. LAWRENCE, and other distinguished Surgeons; sub-digested in the Order of CAUSES, SYMPTOMS, CHIRURGICAL and MEDICAL TREATMENT, DIAGNOSES, PROGNOSSES, Modes of OPERATION, and other Agents employed in HOSPITAL and PRIVATE PRACTICE; including an adapted Pharmacopœia; with connected intermediate PRACTICAL QUESTIONS and ANSWERS, preparatory to Examination before the Royal College of Surgeons; Anatomical Notes, References, Glossary, &c. for the convenience of the Junior Branches of the Profession, Students, &c. Price 12s. bound and lettered.

"This work is well executed, and supplies the place of the 'Surgeon's Vade-Mecum'; it is one of those useful and comprehensive manuals now so popular: every student and junior practitioner ought to possess it. The compiler has laid the best national and foreign works under contribution, and has compressed a vast deal of good information into a small space. The work only requires to be known to be greatly encouraged."—*Dr. Ryan's Medical Journal.*

A Manual of the Practice of Physic.

LONDON MEDICAL, PHARMACEUTICAL, and POSOLOGICAL POCKET-BOOK; explaining the Causes, Symptoms, Diagnostic and Prognostic Signs of Diseases, and Treatment; the Natural and Chemical Characters, Medicinal Properties and Uses, Doses and Forms of Exhibition; Incompatibles, Adulterations, and Official Preparations of the various Substances, Vegetable and Mineral, contained in the Pharmacopœias of London, Edinburgh, and Dublin; in which are introduced the New Medicines, and Latest Discoveries; Classification of Poisons—their Antidotes, Tests, &c.; including Notices from Foreign Materia Medica. With an adapted Conspectus of Prescriptions in Medicine, Surgery, and Midwifery, deduced from standard professional authorities. Price 8s. bound and lettered.

Student's Manual of Practical Chemistry.

PARKINSON'S NEW LONDON CHEMICAL POCKET-BOOK, or MEMORANDA CHEMICA; being a Compendium of PRACTICAL and PHARMACEUTICAL CHEMISTRY, adapted to the Daily Use of the Student. New Edition. By JOHN BARNES, Surgeon-Apothecary. 7s. 6d. bound and lettered.

* * The three preceding volumes are uniformly printed, and will be found not only valuable "POCKET COMPANIONS," or "VADE MECUMS," to assist the memory and facilitate the Student in the acquisition of SURGICAL, MEDICAL, PHARMACEUTICAL, and CHEMICAL knowledge, but also ready and correct appendages to the counter of Town and Country Practitioners; being useful GUIDES to the Junior classes of the profession.

Pharmacologia.

DR. PARIS'S PHARMACOLOGIA; or, HISTORY of MEDICAL SUBSTANCES; with a view to establishing the Art of Prescribing and of Composing Extemporaneous Formulæ, upon Fixed and Scientific Principles. A new Edition, being the Eighth, very considerably improved, and closely printed, in ONE VOLUME OCTAVO, price 11.4s.

* * The Publishers have much pleasure in offering this new edition of Dr. PARIS'S PHARMACOLOGIA to the Public. It is now so printed as to form one handsome volume in octavo (instead of two), and contains much new and valuable matter, derived from the recent discoveries of Dr. Paris in Pharmacological and Chemical Science; and such additional observations respecting the powers of simple and combined remedies as the extended experience of the Doctor has enabled him to offer.

"Dr. Paris's happy illustration of the operation of medicines, as diversified by combination, appears to be peculiarly his own; and he has so far succeeded in reducing his principles to scientific accuracy, and in rendering them applicable to practice, as justly to merit the praise of forming a new era in the departments of pharmacy and prescription. The PHARMACOLOGIA is a work entitled to the double commendation of being admirably suited to the wants of the profession, and the only one of the kind."—*Preface to the Second American Edition.*

*Dr. Henderson's Raspail.***RASPAIL'S NEW SYSTEM of ORGANIC CHEMISTRY.**

Translated from the French, with Notes and Additions, by WM. HENDERSON, M. D. Lecturer on Materia Medica in the University of Aberdeen. Illustrated with numerous Plates, plain and coloured, price 18s. boards.

*** The object of the Author has been to exhibit a connected view of both departments of Organic Chemistry, and thereby to evince the closeness of the relations that subsist between them. He has also pointed out certain causes that have given rise to numerous mistakes in the Analysis of Animal and Vegetable Compounds, and to much misconception regarding the nature of their proximate principles; and by a constant though not lengthened application to Physiology, he has kept continually in view the practical deductions to be drawn from the experimental results which he has recorded, and the theoretical principles which he has developed.

"Our readers will thank us for pointing out this excellent work to their notice: Dr. Henderson's Translation is well executed, and he has enriched it with some useful notes.".... "We must remind our readers, especially our younger ones, that this work is not one to be skimmed, or lounged over, or merely read, but that it requires to be studied or worked through."—*Med. Quar. Rev.* Oct. 1834.

"By all who are desirous to form correct ideas on the chemical constitution of organized bodies, this work should be diligently studied.".... "Of the translation by Dr. Henderson we cannot speak too highly. M. Raspail may congratulate himself that his work is introduced to the English reader by a gentleman who, to correct knowledge of the idiomatic niceties of the languages in which it is written, and complete command over the resources of his own language, conjoins thorough acquaintance with its subject, and whose general information in the physical and physiological sciences so peculiarly qualifies him for facilitating the difficulties and illustrating the obscurities of a branch of science which abounds so much in both. Dr. Henderson has also enhanced much the value of the translation by many instructive notes, either as corrections of mistakes, or as supplements of defects of the author."—*Edin. Medical and Surgical Journal*, Oct. 1834.

Jobson on the Teeth.

TREATISE on the ANATOMY and PHYSIOLOGY of the TEETH, &c.; their DISEASES and TREATMENT. With Practical Observations on ARTIFICIAL TEETH, and Rules for their Construction. Illustrated with Plates of Instruments. By DAVID WEMYSS JOBSON, M.R.C.S. Surgeon-Dentist in Ordinary to His Majesty, and to H. R. H. the Duke of Sussex, &c. 2d Edit. 10s. 6d.

Dr. Paris on Diet.

TREATISE ON DIET; with a view to establish, on practical grounds, a System of Rules for the Prevention and Cure of the Diseases incident to a disordered state of the Digestive Functions. By J. A. PARIS, M.D. F.R.S. &c. Fourth Edition, enlarged, price 10s. 6d.

"Dr. Paris's book should be in the library of every family.—It forms an excellent manual for the investigation of all derangements of the digestive functions, and for the guidance of dyspeptic patients in the regulation of diet."—*Edinburgh Medical Journal*.

Dr. Bostock's History of Medicine.

SKETCH of the HISTORY of MEDICINE, from its Origin to the Commencement of the Nineteenth Century. By J. BOSTOCK, M.D., F.R.S., L.S., G.S., Ast. S., M.C.S., H.S., Z.S., M.R.I., late Pres. of the Edin. Med. Soc., Mem. Geol. Soc. Par., &c. 8vo. price 7s. 6d. cloth.

"This is precisely one of those books which a non-medical man may read with interest; it will form a valuable addition to any general library: for medicine is a branch of philosophy which never should have been separated from the parent trunk: and the sooner it is again re-grafted upon it the better."—*Athenæum*, March 1835.

Dr. Forbes's Medical Bibliography.

MANUAL of SELECT MEDICAL BIBLIOGRAPHY, in which the Books are arranged Chronologically according to the subjects, and the Derivation of the Terms and the Nosological and Vernacular Synonyms of the Diseases are given. With an Appendix, containing Lists of the collected Works of Authors, Systematic Treatises on Medicine, Transactions of Societies, Journals, &c. &c. By JOHN FORBES, M.D. F.R.S. one of the Editors of the "Cyclopædia of Practical Medicine," and of the "British and Foreign Medical Review." In royal 8vo. price 15s.

Paxton's Anatomy.

INTRODUCTION to the STUDY of HUMAN ANATOMY, illustrated by numerous accurate and highly-finished Cuts. By JAMES PAXTON, Member of the Royal College of Surgeons. Price 1*l.* 1*s.* in cloth.

"It is an excellent specimen of a species of publication which cannot fail to be exceedingly useful; an elementary work on anatomy, and anatomy alone, in which the author confines himself to clear, faithful, and precise description of the parts, illustrated by very excellent wood-cuts of the objects, on the same page with the description, constitutes a text-book so convenient, that we think much praise is due to Mr. Paxton for the undertaking. It comprehends the anatomy of the bones, ligaments, muscles, and blood-vessels; and in the course of his description, he has employed 280 figures, illustrating the disposition, configuration, and connexion of the several parts. In the whole treatise, Mr. Paxton has adhered to strict anatomical description, and evidently observed the order, and imitated the brevity, clearness, and precision of Cloquet. These descriptions are rendered greatly more intelligible than they would otherwise be by means of the figures; and the beginner cannot fail to find his progress much facilitated by so agreeable a mode of procuring information."—*Edinburgh Medical Journal*, 1832.

* * * Volume the Second, which completes the work, is just published, price 12*s.*

For Apothecaries' Hall.

LITERAL INTERLINEAL TRANSLATION of the First Ten Chapters of GREGORY'S CONSPECTUS MEDICINÆ THEORETICÆ, with Text; Ordo Verborum; and Rules for Construing and Arranging the Words of Latin Sentences, illustrated by Examples from Celsus and Gregory. By ROBERT VENABLES, A.M. M.D. Oxon.,

"It will prove of great service to students desirous of speedily preparing themselves in the Medical Classics, previous to the operation of the new regulations for extending the classical examination of students after the 1st Oct. 1836.

"An accurate translation, and a great assistance to students."—*London Med. and Surg. Journal*.

"It certainly exhibits proofs of great industry."—*Lancet*, Nov. 1835.

"This is a useful work to students preparing for examination at Apothecaries' Hall."—*Ryan's M. J.*

MANUAL of CHEMISTRY and TOXICOLOGY; comprehending the SYMPTOMS, DIAGNOSIS, MORBID APPEARANCES, ANTIDOTES, TREATMENT, and METHOD of DETECTING POISONS: arranged in the Form of Aphorisms. For the use of Students preparing for Apothecaries' Hall, and Junior Practitioners in Medicine. By Dr. VENABLES. Price 7*s.*

"The student will find it a very useful little work. It comprehends all the practical facts in Chemistry, Pharmacy, and Toxicology, and will be particularly available for impressing on the memory what has been learned at lecture, or from class-books."—*Med. Gaz.*

"We therefore say, that those gentlemen who are preparing for examination at the Hall, will find this little volume of great use to them."—*Ryan's Med. Journal*.

"The toxicological part of this work is excellent."—*Renshaw's Journal*.

"A capital manual for Apothecaries' Hall."—*Johnson's Med. Chir. Review*.

"The enumeration of facts had better be given in the aphoristic form; it is comprehensive, and carries with it a greater degree of precision, as each word expresses an idea."—*Martineau*.

Dr. Osborne on Dropsies.

NATURE and TREATMENT of DROPSIES, connected with SUPPRESSED PERSPIRATION and COAGULABLE URINE; illustrated with a coloured Plate, representing a Kidney in an advanced Stage of the Disease. By JONATHAN OSBORNE, M.D. President of the King and Queen's College of Physicians in Ireland, &c. &c. 5*s.*

"We have read Dr. Osborne's elegantly-written book with much pleasure, and do not doubt, from the new and interesting facts which it embodies, as well as from the instructive manner in which the subject of the disease is treated, that it will shortly be in the hands of all who take an interest in medical discovery."—*Lancet*, Nov. 1835.

DR. CONOLLY'S FOUR LECTURES on the STUDY and PRACTICE of MEDICINE, delivered on different occasions in the University of London. Price 5*s.* neatly bound lettered.

"Until we read these Lectures, we were not prepared to find so high a tone, so liberal and enlightened a spirit, and above all such truly philosophical habits of mind, in a practising physician of the present day. Happy were the students of the University in such a guide: such a tutor was not only likely to lead to sound and safe notions, in medicine, but to virtue and honour, peace and good name. These lectures are as moral as they are medical.

"Were we to extract all the passages in this little work that have given us unfeigned pleasure we should leave nothing behind.

"We trust that this volume will be put into the hands of every medical student in the country. If he do not feel interested in it, it is because he does not understand it; let, therefore, his master take the book up, peruse it in an evening before his pupils, and comment upon it, pointing out such illustrations and examples as every man's experience will supply."—*Spectator*, November 1832.

*Epidemics of the Middle Ages.***DANCING MANIA** in the **FOURTEENTH CENTURY.** 6s.**BLACK DEATH** in the **FOURTEENTH CENTURY.** 5s. 6d.**ENGLISH SWEATING SICKNESS** in the **FOURTEENTH CENTURY.** *In the Press.*Translated from the German of J. F. C. HECKER, M.D.
by B. G. BABINGTON, M.D. F.R.S.

"Dr. Hecker has executed a useful labour in throwing together, from all available sources, the facts relating to the frightful plague of the fourteenth century. Dr. Babington's translation into English has rendered it especially available to the profession and people of this country."—*Lancet*.

"Hecker's account of the 'Black Death,' which ravaged so large a portion of the globe in the fourteenth century, may be mentioned as a work worthy of our notice, both as containing many interesting details of this tremendous pestilence, and as exhibiting a curious specimen of medical hypothesis."—*History of Medicine, by Dr. Bostock.*

Dr. Flood on Hernia.

FOLIO PLATES of **HERNIA**; complete in One Fasciculus, price 10s. 6d.; drawn from Nature by Mr. W. LOVER, M.R.C.S.L.; representing the several Structures concerned in Inguinal and Femoral Hernia as they appear on Dissection, and illustrating, in the fullest manner, the peculiar opinions of Hey, Cooper, Colles, and Guthrie; accompanied by a Letterpress Description of the Anatomy of the Parts and Mode of Operating. By VALENTINE FLOOD, M.D. M.R.I.A. Member of the Royal College of Surgeons in Ireland, and one of the Lecturers on Anatomy in the Richmond Hospital School of Medicine, Dublin.

* * No labour or expense has been spared to make this work a valuable acquisition to Students and those Practitioners who, from Country residence or other circumstances, may not have opportunities for Dissection.

Hunter on the Blood.

TREATISE on the **BLOOD, INFLAMMATION, and GUN-SHOT WOUNDS.** By the late JOHN HUNTER. Complete in one volume, 8vo. illustrated with plates, price 18s. boards.

"I know of no book to which I can refer a surgical student for a satisfactory account of those febrile and nervous affections which local disease produces, except that of Mr. JOHN HUNTER'S **TREATISE** on the **BLOOD, INFLAMMATION,**" &c.—*Mr. Abernethy on Local Diseases.*

Hunter on the Venereal.

TREATISE on the **VENEREAL DISEASE.** By JOHN HUNTER. With an Introduction and Commentary by JOSEPH ADAMS, M.D. In one volume, 8vo. Second Edition, with Additions, price 14s. boards.

Sir John Sinclair on Health and Long Life.

CODE of **HEALTH and LONGEVITY**; or, a General View of the Rules and Principles for **PRESERVING HEALTH and PROLONGING LIFE.** By the Right Hon. Sir JOHN SINCLAIR, Bart. Fifth Edition, in one large volume, 8vo., illustrated with Seven Portraits of Celebrated Persons who attained Extraordinary Ages. Price 20s. Embellished with a Portrait of the Author.

* * Four heavy and expensive Editions of Sir John Sinclair's "**Code of Health**" have stamped its merit and utility: it is the most comprehensive and useful work on Health and Longevity yet published, and has been the storehouse from which all subsequent writers have extracted much valuable information.

"The art of preserving health, and giving longevity to man, forms a link in that chain of useful pursuits to which you have devoted all your time." He adds, "My obligations for the communication of your interesting thoughts upon this subject, are augmented by the advantage and information I have derived by perusing them."—*The Baron D'Edelcrantz.*

"Many subjects are considered in a new point of view; many new and remarkable facts are introduced: on the whole (he states) the author has communicated the most important results regarding the effects of external substances on health."—*Dr. Sprengle's Preface to his Translation of this work into German.*

"The subject is of the greatest importance. The work I have read with great satisfaction, and the observations which it contains are very important."—*Dr. Mathew Baillie.*

TYROCINIUM MEDICUM; or, the **APOTHECARIES' ASSISTANT'S COMPLETE GUIDE**; being a Dissertation on the Duties of Youth apprenticed to the Medical Profession. By the late **WILLIAM CHAMBERLAINE**, of the College of Surgeons, and Fellow of the Medical Society of London. 7s. bds.

PRACTICAL TREATISE on the **EFFICACY** and **SAFETY** of the **DOLICHOS PRURIENS**, or **COWHAGE**, internally exhibited in **DISEASES** occasioned by **WORMS**. By **W. CHAMBERLAINE**. 4s. The Tenth Edition.

HOSPITAL PUPIL; or, Observations addressed to the Parents of Youths intended for the Profession of Medicine or Surgery, on their previous Education, Pecuniary Resources, and the Order of their Professional Studies; with hints to the Young Pupil on the Prosecution of Hospital Studies, on entering into Practice, and on Medical Jurisprudence. By the late **JAMES PARKINSON**, of the Royal College of Surgeons, &c. 2d Edition. Price 5s. bds.

†† This Essay contains many practical observations, applicable to most of the younger candidates for the honours and emoluments of the profession, and may be strongly recommended as a safe and useful guide to parents, who mean to educate their children for the practice of medicine and surgery.—*Monthly Review*.

HINTS for the **IMPROVEMENT** of **TRUSSES**: intended to render their use less inconvenient, and to prevent the necessity of an Under-strap. By the late **JAMES PARKINSON**. 9d.

Skellett on the Diseases of Neat Cattle.

PRACTICAL TREATISE on the **BREEDING COW**, and **EXTRACTION** of the **CALF**, before and at the Time of **CALVING**; in which the question of difficult Parturition is considered in all its bearings; including Observations on the Diseases of Neat Cattle generally. Adapted to the present improved state of Veterinary Practice. Illustrated with Thirteen highly-finished Engravings. By **EDWARD SKELLETT**, Professor of that part of the Veterinary Art. Price 15s. plain; £1. 4s. coloured.

Morley on the King's Evil.

ESSAY on the **NATURE** and **CURE** of **SCROFULOUS DISORDERS**, commonly called the **KING'S EVIL**. Deduced from long Observation and Practice. Forty-second Edition, revised, with Additions, and above Sixty Cases, the Remedies in them used, and occasional Remarks. To which is prefixed, a Plate of the Herb Vervain, and its Root. Published for the good of Mankind, particularly the Common People, by the late **JOHN MORLEY**, Esq. of Halstead, in Essex. Price 1s. stitched.

Scott's Village Doctor.

VILLAGE DOCTOR; or, **FAMILY MEDICAL ADVISER**: adapted to Domestic Convenience, and intended for the use of Country Clergymen, Conductors of Schools, Parents, and Heads of Families. By **JAMES SCOTT**, M.D. Sixth Edition, considerably improved, price 5s.

*** This little work contains such information as may be often wanted in the hour of need: it is a monitor that points out the remedy in a moment of alarm; a pilot that directs the progress of diseases with care; a beacon that shows the shoals upon which health may be wrecked; and a friend that removes the doubtful anxiety of ignorance, by explaining the present, and showing the probabilities of the future.

Renou on Strictures.

PRACTICAL OBSERVATIONS on STRICTURE, and other DISEASES of the URETHRA; describing an effectual Mode of Cure by an internal Medicine; and proving the application of instruments unnecessary, and generally productive of injury; illustrated by Cases, and on the Origin, Symptoms, and Treatment of Stricture of the Rectum, Diseases of the Liver, &c. By WILLIAM RENOU, M.R.C.S. Price 4s. 6d.

Bakewell's Introduction to Mineralogy.

INTRODUCTION to the STUDY of MINERALOGY; or, THE STUDENT'S POCKET COMPANION, to facilitate an acquaintance with this elegant and refined Science. By J. R. BAKEWELL, Esq. F.G.S. C.E. &c. Illustrated with Engravings of the longitudinal and transverse Section of a Tin and Copper Mine. Price 7s. or with the Plates coloured, 8s.

* * All persons who wish to become acquainted with the Science of Mineralogy, will find this volume a valuable acquisition. The proprietors of estates, the artisan, and the manufacturer, may all make it subservient to their respective pursuits and interests.

Published Annually.
